Accept Requirements (Accept 360)

Product Description:

Accept Requirements improves visibility, control and collaboration across dispersed teams and enables you to:

- Create detailed product plans that ensure top-down and bottom-up alignment from strategy through product requirements
- Manage requirements and roadmaps in the context of customers, markets, and competitors
- Visually evaluate alternate plans based on comprehensive market and product data – not inference or intuition – and adjust product investments to maximize value and minimize risk
- Easily produce market and product requirements documents
- Manage project schedules, resources, budgets, and risks through product planning, development, and launch

Avenqo PEP Version 1.5

Product Summary:

Avenqo PEP is a integrated development platform based on Eclipse which supports the complete system development process by various integrated functionalities. It integrates different project disciplines into a single repository:

- Requirements Management
- Test Management
- Issue & Change Management
- Collaboration Management

Hence, Avenqo PEP provides a common Knowledge Repository for the complete project team. This ensures the transparency of quality and progress which is accessible for all team members and stakeholders.

The advantages of this specific approach for the users are:

- **One unique repository** for **all project** information instead of a conglomeration of files, orders, databases, paper, e-mails and tasks etc. makes it easier to find relevant **information**
- The latest information with an accompanying **change history** is always available
- **Connections and** dependencies between **artefacts** which are part of different areas of responsibility can be visualized (i. e. requirements documents [product management] & test cases [quality assurance])
- The **project reporting is simplified** since an effortful migration of different data sources is dispensable
- Creation of **user-specific** views (requirement engineers, testers, project managers etc..)
- **Transparency** of all **project information** over all project phases
- **Full traceability** for all kind of artefacts created in a project
- **Baselining** (project deliveries and analyse the applied changes) and Offlining (working with Avenqo PEP without being connected to the online repository) of the complete project knowledge

Additionally, Avenqo PEP is characterized by the following features

- **Rich text editor**
- **Integration of office documents**
- **Comprehensive reporting component**
- **Supporting the communication inside the team by electronic discussions and task management**
- **Excellent price-performance ratio**
- **Highly configurable** regarding permissions, workflows, attributes and templates
- **Based on a modern and extendable** technology for different operating systems

Blueprint Requirements Center 2010

Product Summary:

Blueprint is a global leader in requirements, delivering the industry's first requirements workbench purpose built for today's software requirements authors. Blueprint's product, Requirements Center™, empowers authors and reviewers to visually define, simulate, validate, and publish requirements for context and comprehension-rich collaboration with increasingly distributed and 3rd-party stakeholders—from the capture of business process definitions and textual requirements, to all the way through more complex use cases, data, business rules, UI simulations and complete test case generation.

Cameo Requirements+

Product Summary:

Cameo Requirements+ is a great tool for requirements development in any domain. The tool supports various types of data like formatted text, video, Flash, audio, and others to form rich and descriptive requirement documentation. A key innovation is Cameo Storyboard which is built into the product. This storyboard is meant to model many different stories from your own library of scenes to build the overall capability of a product or any other activity that you need to explore. The tool generates a live flowchart that shows the different paths possible, based on the aggregation of all your stories. MagicDraw SysML Plugin is used to model requirements in MagicDraw UML. The tool has multiple features for System Engineering modeling, but also excels at general requirements modeling with UML, UPDM (for DoDAF, MoDAF, Enterprise Architecture) modeling. A key feature is that requirements are linkable to items in the model like classes or methods in designs or to modeled tests that verify requirements. This changes the requirement lifecycle to support development and detail design with gap analysis and validation that you have completed your assigned requirements. A related tool called Cameo DataHub is used to link Cameo Requirements+ to MagicDraw that synchronizes the requirements between the tools.

CASE Spec Version 8.15

Product Summary:

CASE Spec is a high performance enterprise software for specification, advanced requirements tracking, analysis as well as verification and validation of systems. This web-enabled tool is flexible to adopt and model any lifecycle process. It includes an award winning set of visual and tabular tools for traceability, impact and gap analysis. It provides integrated change management, workflow, diagramming, document management, reporting and document generation.

Contour by Jama Software (Contour) Version 2.9

Product Summary:

Jama Software's solution called Contour, takes a collaborative approach to solving the traditional requirements management problem. Contour is a powerful web-based application that cuts product planning cycles in half, reduces development errors and ensures higher quality products. Contour enables greater success by helping people stay closely aligned to their customers' needs and to other members of the team throughout the development process. This collaborative approach to requirements management is enabling companies to innovate faster. Contour customers include Intel, Boeing, Volvo, SMART Technologies, Wiley, Wells Fargo, ING, Virgin, Fluid and Stratos Global.

Dimensions RM (DimRM) Version 10.1.4

Product Summary:

An essential component of Serena Dimensions 10, Dimensions RM ensures that project teams effectively collect and refine project requirements. Dimensions RM allows enterprises to effectively manage change in requirements during the project lifecycle. Dimensions RM automates requirements management throughout the development lifecycle, making it easy to:

- Gather and logically link associated requirements
- Collaborate on requirements definitions
- Baseline requirements for project milestones
- Understand the impact of requirement changes
- Link requirements to development projects
- Report on requirements definition, baselines, change impact, and traceability

Envision VIP Version 9

Product Summary:

ENVISION® VIP is an agile and highly configurable enterprise modeling and knowledge integration environment supporting numerous enterprise activities. ENVISION is built on a highly adaptive Object-Oriented multi-user repository. Requirements can be easily linked to design objects, use cases, or any other information/aspect of an organization. New requirement types can be easily added, managed, analyzed, and reported on at any time. User group security allows for exposing and hiding sensitive information to/from those stakeholders with the appropriate levels of “need to know.” Change history and versioning are fully supported. Envision seamlessly interfaces with existing MS Office applications. Users can literally drag & drop existing data from Word, Excel, and Access directly into its repository. Visio diagrams, XML-based data, and much more can also be easily. Previously unsynchronized collections of data when entered into the repository become consistent. Accountability, analysis, and status information is leveraged and available to all interested/affected stakeholders.

IBM Rational RequisitePro Version 7.1

Product Summary:

IBM Rational® RequisitePro® is a requirements management tool for project teams who want to manage their requirements, write good use cases, improve traceability, strengthen collaboration, reduce project risk, and increase quality.

- Uses advanced real-time integration with Microsoft® Word to provide a familiar environment for activities such as requirements definition and organization
- Incorporates a powerful database infrastructure to facilitate requirements organization, integration, traceability and analysis
- Enables detailed attribute customization and filtering to maximize the informative value of each requirement
- Provides a fully functional, scalable web interface optimized for usage in a geographically distributed environment
- Provides detailed traceability views that display parent/child relationships and shows requirements that may be affected by upstream or downstream changes
- Performs project version comparisons using XML-based project baselines
- Integrates with multiple tools in the IBM Software Delivery Platform to improve accessibility, communication and traceability of requirements
- Operating systems supported: Windows

Kovair Global Lifecycle (Kovair) Version 5.5

Product Summary:

Kovair offers an Enterprise Class web architected Lifecycle and IT Management Solution that comes with out-of-the-box functionalities like Requirements, Test, Incidence, Change and Help-desk Management. It also allows for the creation of multiple “User Defined Applications” in the same framework. Its built-in, configurable and task based “Omniprocess Workflow” can automate any product development or IT process with graphical design capability. Kovair’s SOA based Omnibus Integration Bus provides an open and easy integration platform for integrating multi-vendor tools for a true integrated development and IT ecosystem. This enables traceability, process automation, synchronized project management and reporting.

Reqtify Version 2010-1A

Product Summary:

Reqtify is an interactive requirement traceability and impact analysis tool which can trace requirement from system, program and project levels to the entire levels of your software or hardware component development lifecycle. Reqtify can interface to requirement-related information in a wide variety of data formats, document types and file formats. These can include corporate requirement repositories such as IBM Rational DOORS™ and RequisitePro™, Borland CaliberRM™, 3SL Cradle™, office type documents such as Microsoft Word, Excel, Adobe Framemaker and PDF, UML Design tools such as ARTiSAN Studio, Enterprise Architect, CAD tools such as Simulink, Code files such as C, Ada, C++, Java or VHDL as well as information in standard text format, Html, XML or RIF.

Requirements Manager (ReMa)

Product Summary:

ReMa is a requirements management tool used to define, prioritize, and maintain requirements, usually for software and systems applications. ReMa can support both extremely complex and fine-grained requirements as well as higher-level business requirements, ensuring that they are fully traceable throughout a project. ReMa increases the quality of systems engineering, business-critical IT and software development projects by improving requirements communication and collaboration. It enhances the product quality by increasing the visibility of business objectives, customer needs, technical specifications, and regulations. With powerful capabilities for capturing, linking, analyzing, and managing changes to requirements and their traceability, this software ensures conformance to user requirements.

RTIME Version 5.7

Product Summary:

RTIME is an All-in-1 SE and SDLC Management Tool and Technique used by our clients to enrich the Requirement definition and traceability, cross-team communication, definition and repeatability of all testing phases, discipline and quality of your Product Development Process. RTIME's primary market differentiator is their bi-directional gateway with MindManager, from the pioneers and market leader of Visualization, MindJet:

*Our RTIME ↔ Mind Manager bi-directional gateway facilitates, expedites and delivers with precision **THE** most important Project Document: The Requirements Sign-off Package. Proper Requirement collection, refinement, approval and sign-off provide the roadmap for every downstream stage of your project. Drag and drop relationships and dependencies between requirements, assign priorities, ownership and invoke the RTIME wizard to send your project 'vision' directly into a powerful, all-in-one SDLC management system.*

Other market differentiators resulting in huge time and cost savings include:

- **5 channels for Requirement elicitation** - including the RTIME User Interface, a configurable email box, a bi-directional Excel Upload utility, a web-portal for customers and external users and the bi-directional Mind Manager gateway.
- **14 Points of Traceability** - Ties Requirements to Sources, Project Tasks, other requirements, every phase of testing, organizational assets, Issues, Dependencies, etc.
- **Limitless Reporting** - Invoke any of the 50+ standard reports or design your own. The web-based dashboard provides a vantage point to all project participants and is license-free. Simply supply your stakeholders the URL to provide them view-only transparency.
- **Powerful Search Engine** - Every piece of project information is at your fingertips. Search by title, type, status, date, owner, etc. to immediately locate Projects, Requirements, Tests, Issues, Risk Factors, Tasks, etc.
- **Audit and Change History** - History module tracks EVERY change. Interfaces with MS Word to compare any 2 versions of a requirement, redlined and revision-tagged.

TraceCloud

Product Summary:

TraceCloud is a web based (Software As A Service (SAAS) and On Premises) requirements management solution that leverages web 2.0 technologies for defining, collaborating, approving, tracking and delivering requirements to completion. Some critical features are:

- A rich integration with Microsoft Excel and Word, combined with an innovative bulk edit/reporting format makes it a very usable and powerful system with very low barriers to entry.
- Prebuilt dashboards give multiple perspectives for looking at your data. For example, you can track the progress by project, release, user, baseline or folder levels.
- Fine grained control at folder and project level lets you control your requirements and lock down your folders based on your needs.
- Flexibility to customize your requirement types, attribute and approval work flow rules, helps tune to tool to suit your process needs
- Embedded metrics and trend charts (burn down charts, traceability charts, etc.) ensure that you are progressing in the right direction.
- Build for scalability. The only platform that's designed from ground up to support projects with 100,000+ requirements and traceability.
