Verification & Validation with Model-Based Design

Lyle Shipton
Application Engineer
MathWorks
Plano, TX
Background

- University of Illinois at Urbana-Champaign
  - B.S, M.S. Aerospace Engineering
- SpaceX Rocket Development Facility
  - Test Engineer
  - Lead Engineer, Integration & Test
- Eaton Aerospace, Fuel and Motion Controls
  - Lead Aerospace Systems Engineer
- MathWorks, Application Engineering Group
  - Lead Engineer, Aeronautical applications
MathWorks at a Glance

- Privately held
- 4000 employees worldwide
- More than 3 million users in 180+ countries

Office locations

Distributors serving 16 countries
Core MathWorks Products

MATLAB®

- Designed for engineers and scientists
- Professionally developed, tested, and documented
- Toolboxes for:
  - Machine learning, data analytics, deep learning, image processing and computer vision, signal processing and communications, computational finance, robotics and control systems
- Interactive apps that automatically generate programs
- Easily scales to clusters, GPUs, and clouds
- Direct deployment to production enterprise applications
- Automatic conversion to embeddable C and CUDA code
- Integrates with Simulink to support Model-Based Design
Core MathWorks Products

SIMULINK™
Simulation and Model-Based Design

Model and simulate your system
- Use one multi-domain environment
- Model the system under test and the plant
- Simulate how all parts of the system behave

Test early and often
- Test your system under all conditions
- Validate your design with real-time testing
- Trace from requirements to design to code

Automatically generate code
- Generate production-quality C and HDL code
- Deploy directly to embedded processors or FPGA’s/ASIC’s
### Key capabilities for engineers and scientists

MCU
DSP
FPGA
ASIC
Analog Hardware

TEST AND VERIFICATION

INTEGRATION
Key Takeaways

1. Find bugs early, develop high quality systems
2. Replace manual verification tasks with workflow automation
3. Learn about reference workflow that conforms to safety standards

“Reduce costs and project risk through early verification, shorten time to market on a certified system, and deliver high-quality production code that was first-time right” Michael Schwarz, ITK Engineering
Safety of Electronic Systems

- Critical functionality in industries such as Aerospace, Automotive, and Industrial Automation

- Real-time operation
  - Compute time lag cannot be tolerated

- Predictable behavior
  - No unintended functionality

- Must be robust
  - Program crash or reboot not allowed
Role of Certification Standards

- **DO-178 (Avionics)**
  - Guidelines for the safety of software in certain airborne systems
  - Level A to E (most critical to least)
  - Verification activities include review of requirements and code, testing of software, code coverage

- **ISO 26262 (Automotive)**
  - Defines functional safety for automotive electronic systems
  - Automotive Safety Integrity Level ASIL QM, A to D (least to most; derived from severity, controllability, probability)
  - ISO 26262-6 pertains to software development, verification, and validation

- **IEC 61508 (Industrial Automation & Machinery)**
  - General functional safety standard, originally for process control industry
  - Safety Integrity Level SIL 1 to 4 (least to most; derived from exposure to demand needs and probability of failure)
  - Defines the software requirements and lifecycle for software, that includes validation and verification
Reference Verification and Validation Workflow
A Systems of Systems (SoS) is comprised of Operational Deliverables, e.g.:
- Ground Station
- Aircraft
- Communications Relay
- etc
An Operational Entity (e.g. an Aircraft) is comprised of Systems:
- Vehicle Management System
- Payload
- Electrical Power

A System (e.g. Vehicle Management) is comprised of Items:
- Flight Control Computer
- Sensors
- Actuators
Each Software Module is Embedded Object Code that satisfies the Requirement(s) allocated to that Module.
Verification and Validation
Tasks and Activities
Verification and Validation Tasks and Activities

- Find missing or incomplete requirements
- Are requirements sufficiently specified
- Identify requirements inconsistencies
- Product: Simulink Requirements*

• Simulink Requirements*

• Simulink
• Stateflow
• Simulink Report Generator: System Design Description*
Simulink Requirements
Work with requirements and design together

- Author, edit and organize requirements
- View and link requirements within the Simulink graphical editor
- Track status and manage requirement changes
- Trace requirements to models, generated code, and test cases
Verification and Validation Tasks and Activities

- Check design for various standards
  - DO-178, MAAB, ISO 26262, ...
- Ensure design consistency
  - Between Teams, Suppliers, ...
- *Product: Simulink Check*

- Simulink: Model Advisor
- Simulink Check: DO-178C/DO-331 Checks*

- Requirements Validation
- Model Conformance
- Source Code Conformance
- Object Code Verification
- Code on Target

MathWorks
Example

Is there a potential error in this model?  It depends…
Example

How about now?

When generating code:
- Floating-point precision issues may lead to incorrect comparison results

Is this a production model?
- Implementation requires a fixed-step, discrete solver

- Ports do not follow established naming conventions
Simulink Check
Automate verification and correct models to improve design

Standards & Guidelines Checks
• Automate compliance to standards
• Create custom checks

Edit Time Checking
• Find and fix compliance issues while you design

Model Metrics
• Analyze your model for complexity, size, reusability
• Assess design quality

Model Refactoring
• Find clones and modeling patterns.
• Refactor to improve maintainability
Verification and Validation Tasks and Activities

- Does design meet requirements
- Confirm correct design behavior
- Verify no unintended behavior

*Product: Simulink Test*
Functional Testing Process

- Author test-cases that are derived from requirements
  - Use test harness to isolate component under test
  - Test Sequence to create complex test scenarios

- Manage tests, execution, results
  - Re-use tests for regression
  - Automate in Continuous Integration systems such as Jenkins
Test Harness

- Harnesses contained in the model file or external
- Build harness at unit (subsystem) or system level
- Synchronized test environment (harness ↔ model)
- Enables unit testing without requiring new model
- Configure harness input and output blocks
- Supports SIL, PIL, HIL
Test Sequence/Assessment Block

✓ Reactive and/or time based test cases
✓ Easier translation of test procedures
✓ Built on top of Stateflow with extensions for testing (SF license not required)
✓ Subset of MATLAB language
✓ Steps are temporal or logic-based
✓ Create complex test inputs and assessments
✓ Supports debugging (breakpoints)
Test Manager

- Create test cases
- Group into suites and test files
- Execute individual or batch
- View result summary
- Analyze results
- Archive, export, report
Verification and Validation Tasks and Activities

- **Simulink Design Verifier**
  - Prove design meets requirements
    - Formally verify requirements and safety
    - Test case generation for functional testing
  - Prove that the design is robust
    - Check that the design does not contain errors such as overflow, divide by zero, dead logic, ...
  - **Product: Simulink Design Verifier**
Checks that design meets requirements
- Gear 2 *always* engages when speed $\geq 5$ and $\leq 25$
- Gear 2 *never* engages when speed $< 5$ or $> 25$

Test Condition

Test Objective

Automatically generate functional test case
- Custom objectives signals must satisfy in tests
- Constraints on signal values for test generator

Detect overflows, divide by zero, and other robustness errors
- Proven that overflow does NOT occur
- Proven that overflow DOES occur
Verification Task

- Coverage metric
  - Measure of how much system has been tested
- Identify testing gaps to find
  - Untested design elements
  - Dead logic and unreachable states
- Identify requirement issues
  - Missing or inconsistent functional requirements
  - Discover requirement problems early
- Product: Simulink Coverage
Simulink Coverage

Measure test coverage in models and generated code

- Structural coverage analysis and reports from tests performed on Simulink® models (including C/C++ S-functions)
- Coverage metrics including decision, condition, MC/DC, relational boundary, and signal range
- Coverage analysis of C/C++ code generated by Embedded Coder®
- Coverage result highlighting in blocks, subsystems, and state charts
- Tool qualification support (with DO Qualification and IEC Certification Kits)
Model Elements That Receive Coverage

- Simulink models
- MATLAB function blocks
- Stateflow charts
- C/C++ code S-Functions
- Generated code
Verification and Validation Tasks and Activities

- Model Verification Compliance
- Source Code Verification Compliance
- Code on Target

- Requirements Validation
- Model Conformance
- Source Code Conformance
- Object Code

- Simulink Design Verifier: *Property Proving*

- Automate manual task of writing test-cases and test inputs
  - Intelligent determination of input combinations for high coverage
- Formal methods based test generation
  - Analyze design, states, logic paths in the design model

*Product: Simulink Design Verifier*
Addressing Missing Coverage

Step 1
- Functional Tests
- Design Model
- Coverage Analysis

Step 2
- Test Generator (Simulink Design Verifier)
- Additional Tests

Step 3
- Coverage Analysis
- Coverage Report
  - Full Coverage (100%)
  - Partial Coverage (less than 100%)
Verification and Validation Tasks and Activities

- Checks conformance to coding standards
  - MISRA (Motor Industry Software Reliability Association)
- Finds bugs
  - In the integrated code
- Products: Polyspace Bug Finder

Polyspace Bug Finder*
- Checks conformance to coding standards
  - MISRA (Motor Industry Software Reliability Association)
- Finds bugs
  - In the integrated code
Verification and Validation Tasks and Activities

- Proves absence of run-time errors
  - In the integrated code

- **Products: Polyspace Code Prover**

*Polyspace Code Prover*
Static Code Analysis Techniques Supported by Polyspace

- Code metrics and standards
  - Comment density, cyclomatic complexity,…
  - MISRA and Cybersecurity standards

- Bug finding
  - Data and control flow of software
  - Check code for security vulnerabilities

- Code proving
  - Formal methods with abstract interpretation
  - No false negatives

Green: reliable
safe pointer access

Red: faulty
out of bounds error

Gray: dead
unreachable code

Orange: unproven
may be unsafe for some conditions

Purple: violation
MISRA-C/C++ or JSF++
code rules

Range data
tool tip

Results from Polyspace Code Prover
Traceability from Code to Model

Polyspace Bug Finder and Polyspace Code Prover verification results, including MISRA analysis can be traced from code to model.
Verification and Validation Tasks and Activities

- **Requirements Validation**
- **Model Conformance**
- **Source Code Conformance**
- **Model Verification Compliance**
- **Source Code Verification Compliance**
- **Object Code Verification Compliance**

- **Code on Target**

- Embedded Coder: SIL/PIL
- Simulink Test*
- Simulink Coverage: SIL/PIL Code Coverage*
Software In the Loop (SIL) Testing

- Show equivalence, model to code
- Assess code execution time
- Collect code coverage

DO-178C
DO-331
DO-333
Bell Helicopter Develops World’s First Commercial Fly-by-Wire Helicopter

Challenge
Develop flight software for the first commercial fly-by-wire helicopter and certify it to DO-178B Level A

Solution
Use Model-Based Design to model and simulate the control laws, trace requirements to the model, and generate and verify 16,000 lines of code

Results
- Integration time cut by 90%
- Development iterations reduced from weeks to hours
- Confidence in code quality maintained
- Simulink Code Inspector Qualified by FAA for DO-178B Level A

“With Model-Based Design we had a successful first flight; there were no issues from a control or integration standpoint. Generating the control law code from our Simulink model with Embedded Coder eliminated the slowdowns caused by manual code generation and freed the team to work on meeting the broader program goals.”
- Mike Bothwell, Bell Helicopter

The Bell 525 Ships 1 and 2 over the Palo Duro Canyon.

Link to user story
BAE Systems Delivers DO-178B Level A Flight Software on Schedule with Model-Based Design

Challenge
Develop flight-critical software for a midsized business jet in compliance with DO-178B Level A standards

Solution
Use Model-Based Design to model the software and systems, run simulations with customer-provided test vectors, trace requirements to model elements, and generate 200,000 lines of certified code

Results
- Development efficiency doubled
- Certification schedule maintained
- Communication between teams facilitated

“When we generated code from our Simulink models with Embedded Coder, the team we handed it off to knew it was gold—that it was debugged and fully met the requirements—because we had run it through the Simulink test vectors supplied by our customer. That was a huge advantage on this program.”
- Maria Radecki, BAE Systems
ESA and Airbus Create Upper-Stage Attitude Control Development Framework Using Model-Based Design

Challenge
Speed the development of software for controlling complex launcher upper stage missions including the attitude of satellite payloads after they separate from ESA launch vehicles

Solution
Use Model-Based Design to develop controller models and multidomain physical models, run closed-loop simulations, and generate code for PIL testing

Results
- Design iterations reduced from one week to one day
- Failure modes modeled and eliminated
- Comprehensive design framework established

"Model-Based Design multiplies the range of capabilities that I have as an engineer. As an individual control engineer I can do what previously took a handful of engineers, because I can create and simulate my own multidomain models. I don't have a wall around me anymore; I am able to better communicate and contribute across disciplines.”
- Samir Bennani, ESA
