Case Studies

Royal Philips

Industry: Medical Technology

“

Philips is continuously driving to develop high-quality software in a predictable, fast and Agile way. SAFe addresses this primary goal, as well as offering these further benefits: reduced time to market and improved quality, stronger alignment across geographically distributed multi-disciplinary teams, and collaboration across teams to deliver meaningful value to customers with reduced cycle time.

—Sundaresan Jagadeesan,
Program Manager – I2M Excellence SW Development Program

Results

- Average release cycle time down from 18 months to 6 months
- Feature cycle time reduced from >240 to <100 days
- Sprint and PI deliveries on time, leading to “release on demand”
- Quality improvements—zero regressions in some business units
- 5 major releases per train per year on demand

What we have gained through the introduction of SAFe

- Insufficient work on design and architecture
- Silos between scrum teams
- Dependency and integration issues
- Unclear overall objectives & plan
- Lack of visibility of the big picture
- Scrum of scrum not being effective

- Improved quality
- Cross site and cross functional collaboration
- PI Planning provides both vertical and horizontal alignment
- Transparency through Rally, reports & SAFe ceremonies
- Agile Portfolio estimation & planning drives realistic Portfolio plan

Emulators

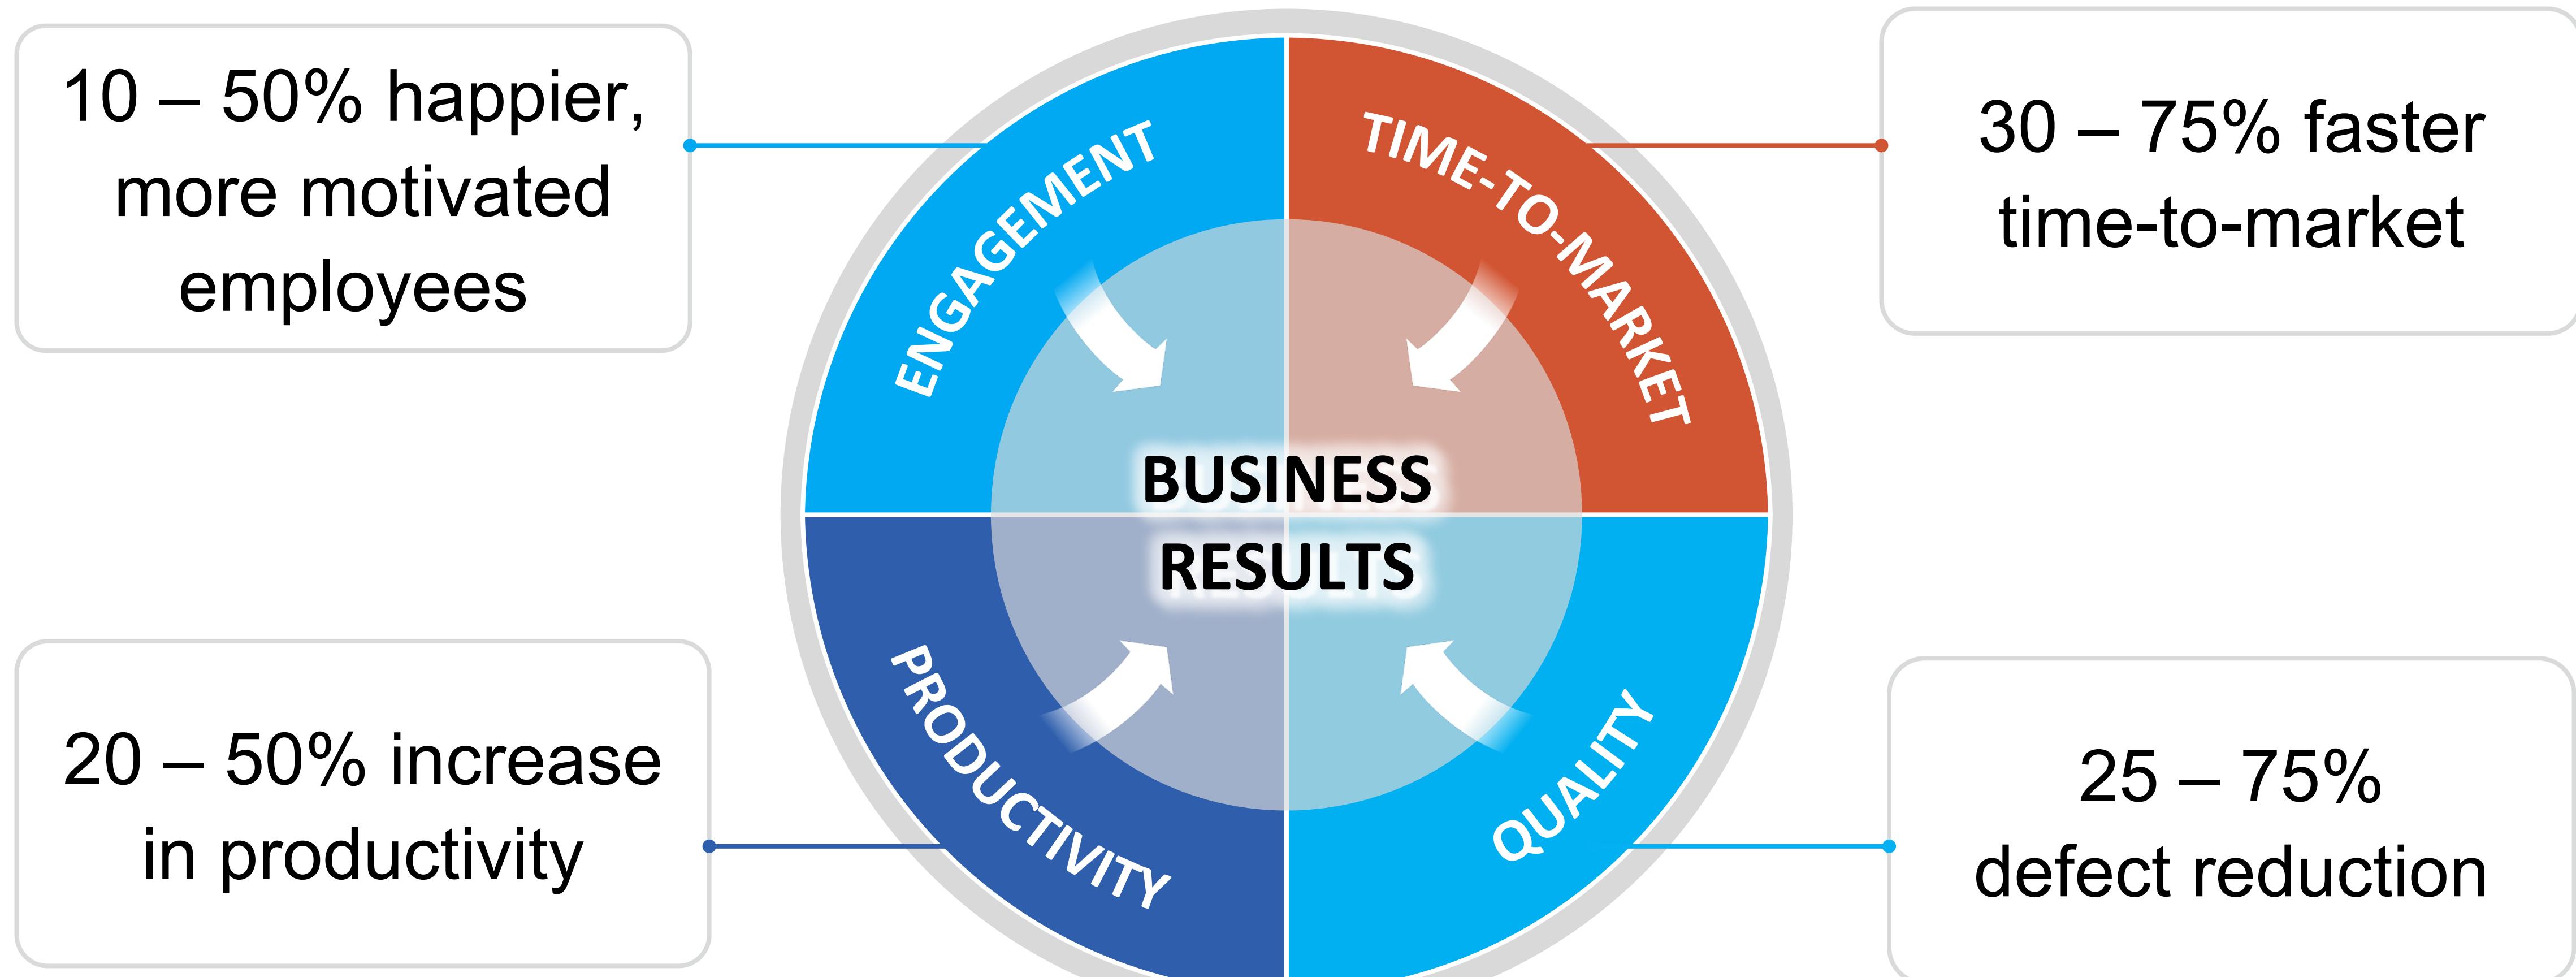

Elektar Medical Radiotherapy:

The software teams/program uses emulators of the hardware for frequent integration testing. At critical milestones (identified in Program Increment planning, based on the nature of the work) the software is installed into devices in a testing “bunker”. This is usually at least twice per Program Increment.

The Components of Better Economics

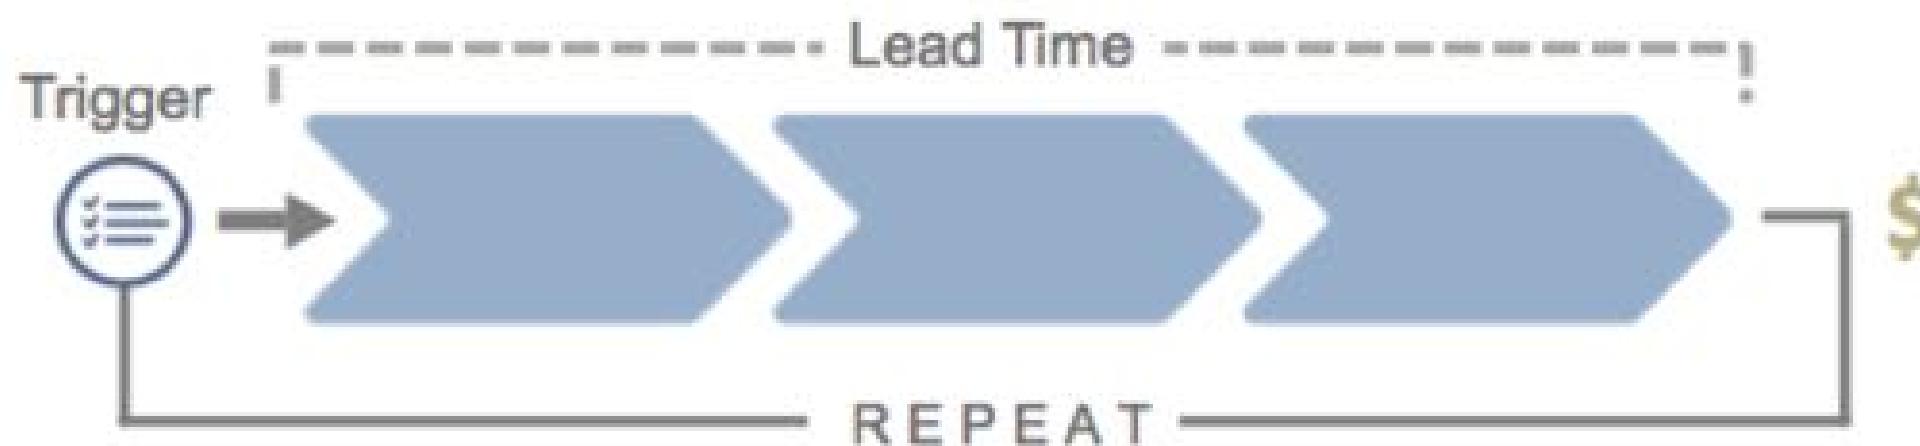

SAFe® - Business Results

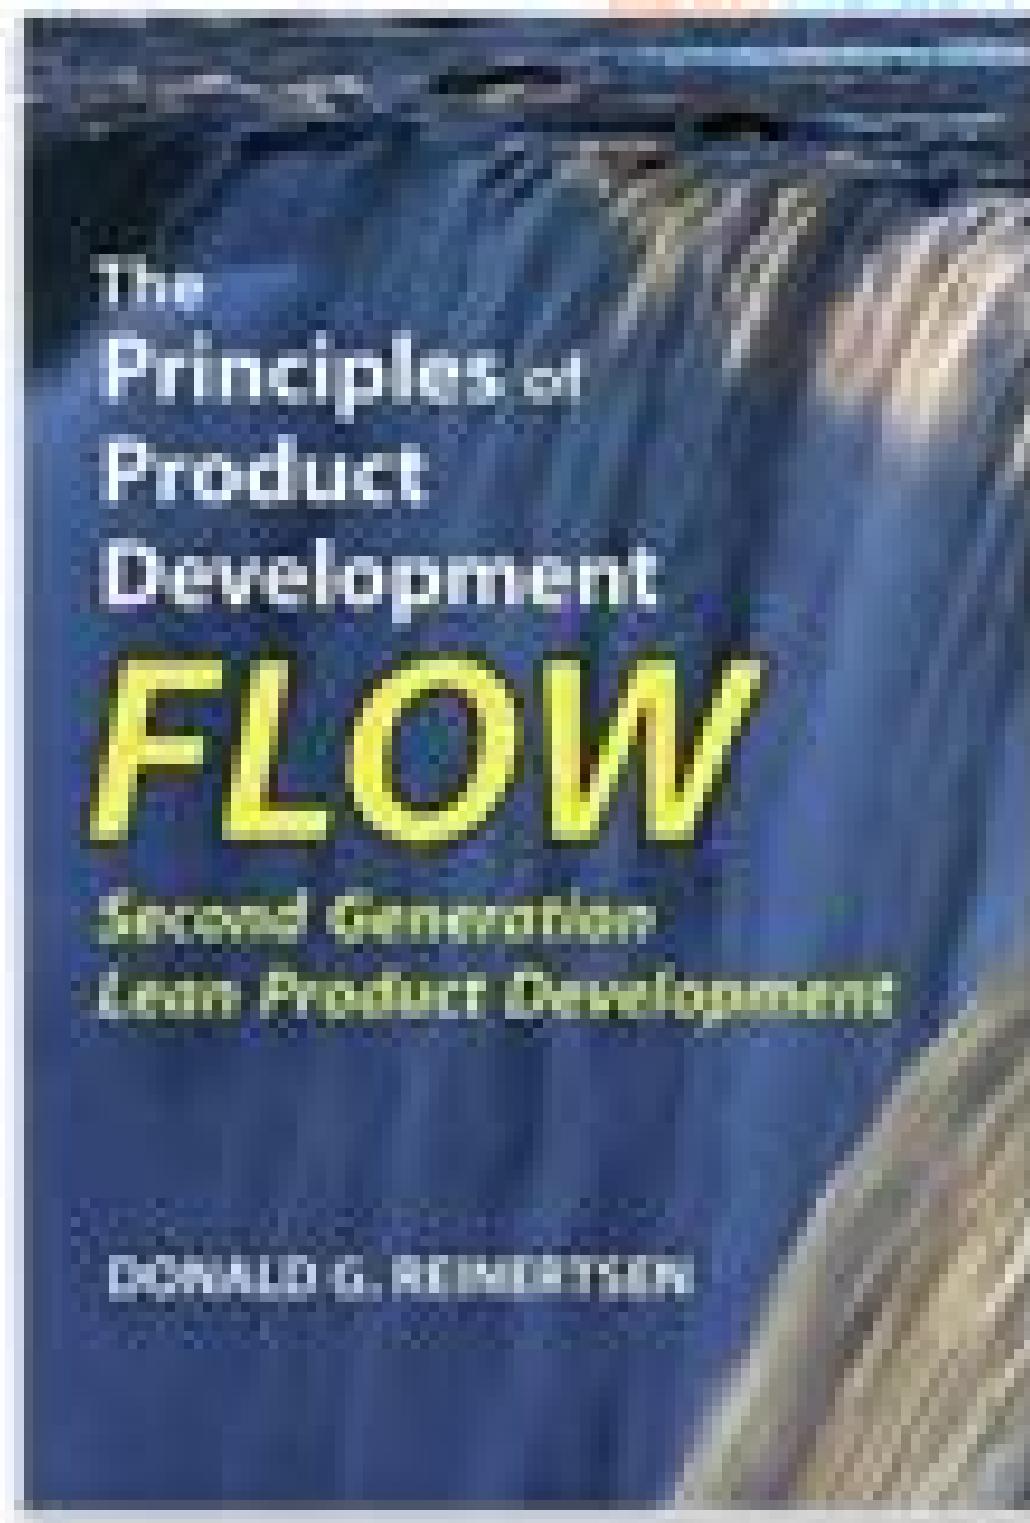

See scaledagile.com/case-studies

Apply Systems Thinking

- Identify customer value and map flow of work towards delivery
- Take systems view in organizing, planning, and executing delivery
- Eliminate waste across the entire value stream
 - Anything that doesn't create value for customer is waste
 - Examples of waste – features not used, delays, handoffs/dependencies, context switching (many project assignments), defects

“...the dominant paradigm for managing product development is wrong. Not just a little wrong, but wrong to its very core.” So begins Reinertsen in his meticulous examination of today’s product development practices. He carefully explains why invisible and unmanaged queues are the underlying root cause of poor product development performance. He shows why these queues form and how they undermine the speed, quality, and efficiency in product development. Then, he provides a roadmap for changing this.

Components of Better Economics

Small Batch Sizes

Fast Feedback Cycles

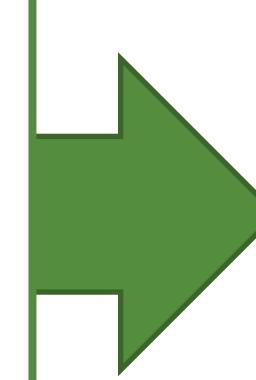

Collaboration

Relentless Improvement

Batch Size Optimization

Big enough to

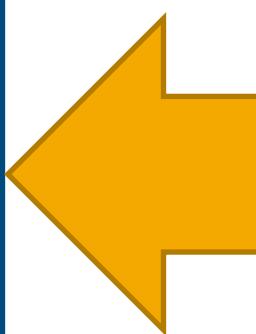

- Demonstrate value
- Learn from
- Validate assumptions

2 weeks,
90%
capacity

3 weeks,
75%
capacity

Small enough to

- Keep focus
- Keep errors from propagating
- Support adjustment economics

The goal is to reduce the risk of late integration breakage.

Batch Size – Components of Economics

Transaction cost

Holding Cost

Variability in flow

Risk

Motivation

Efficiency

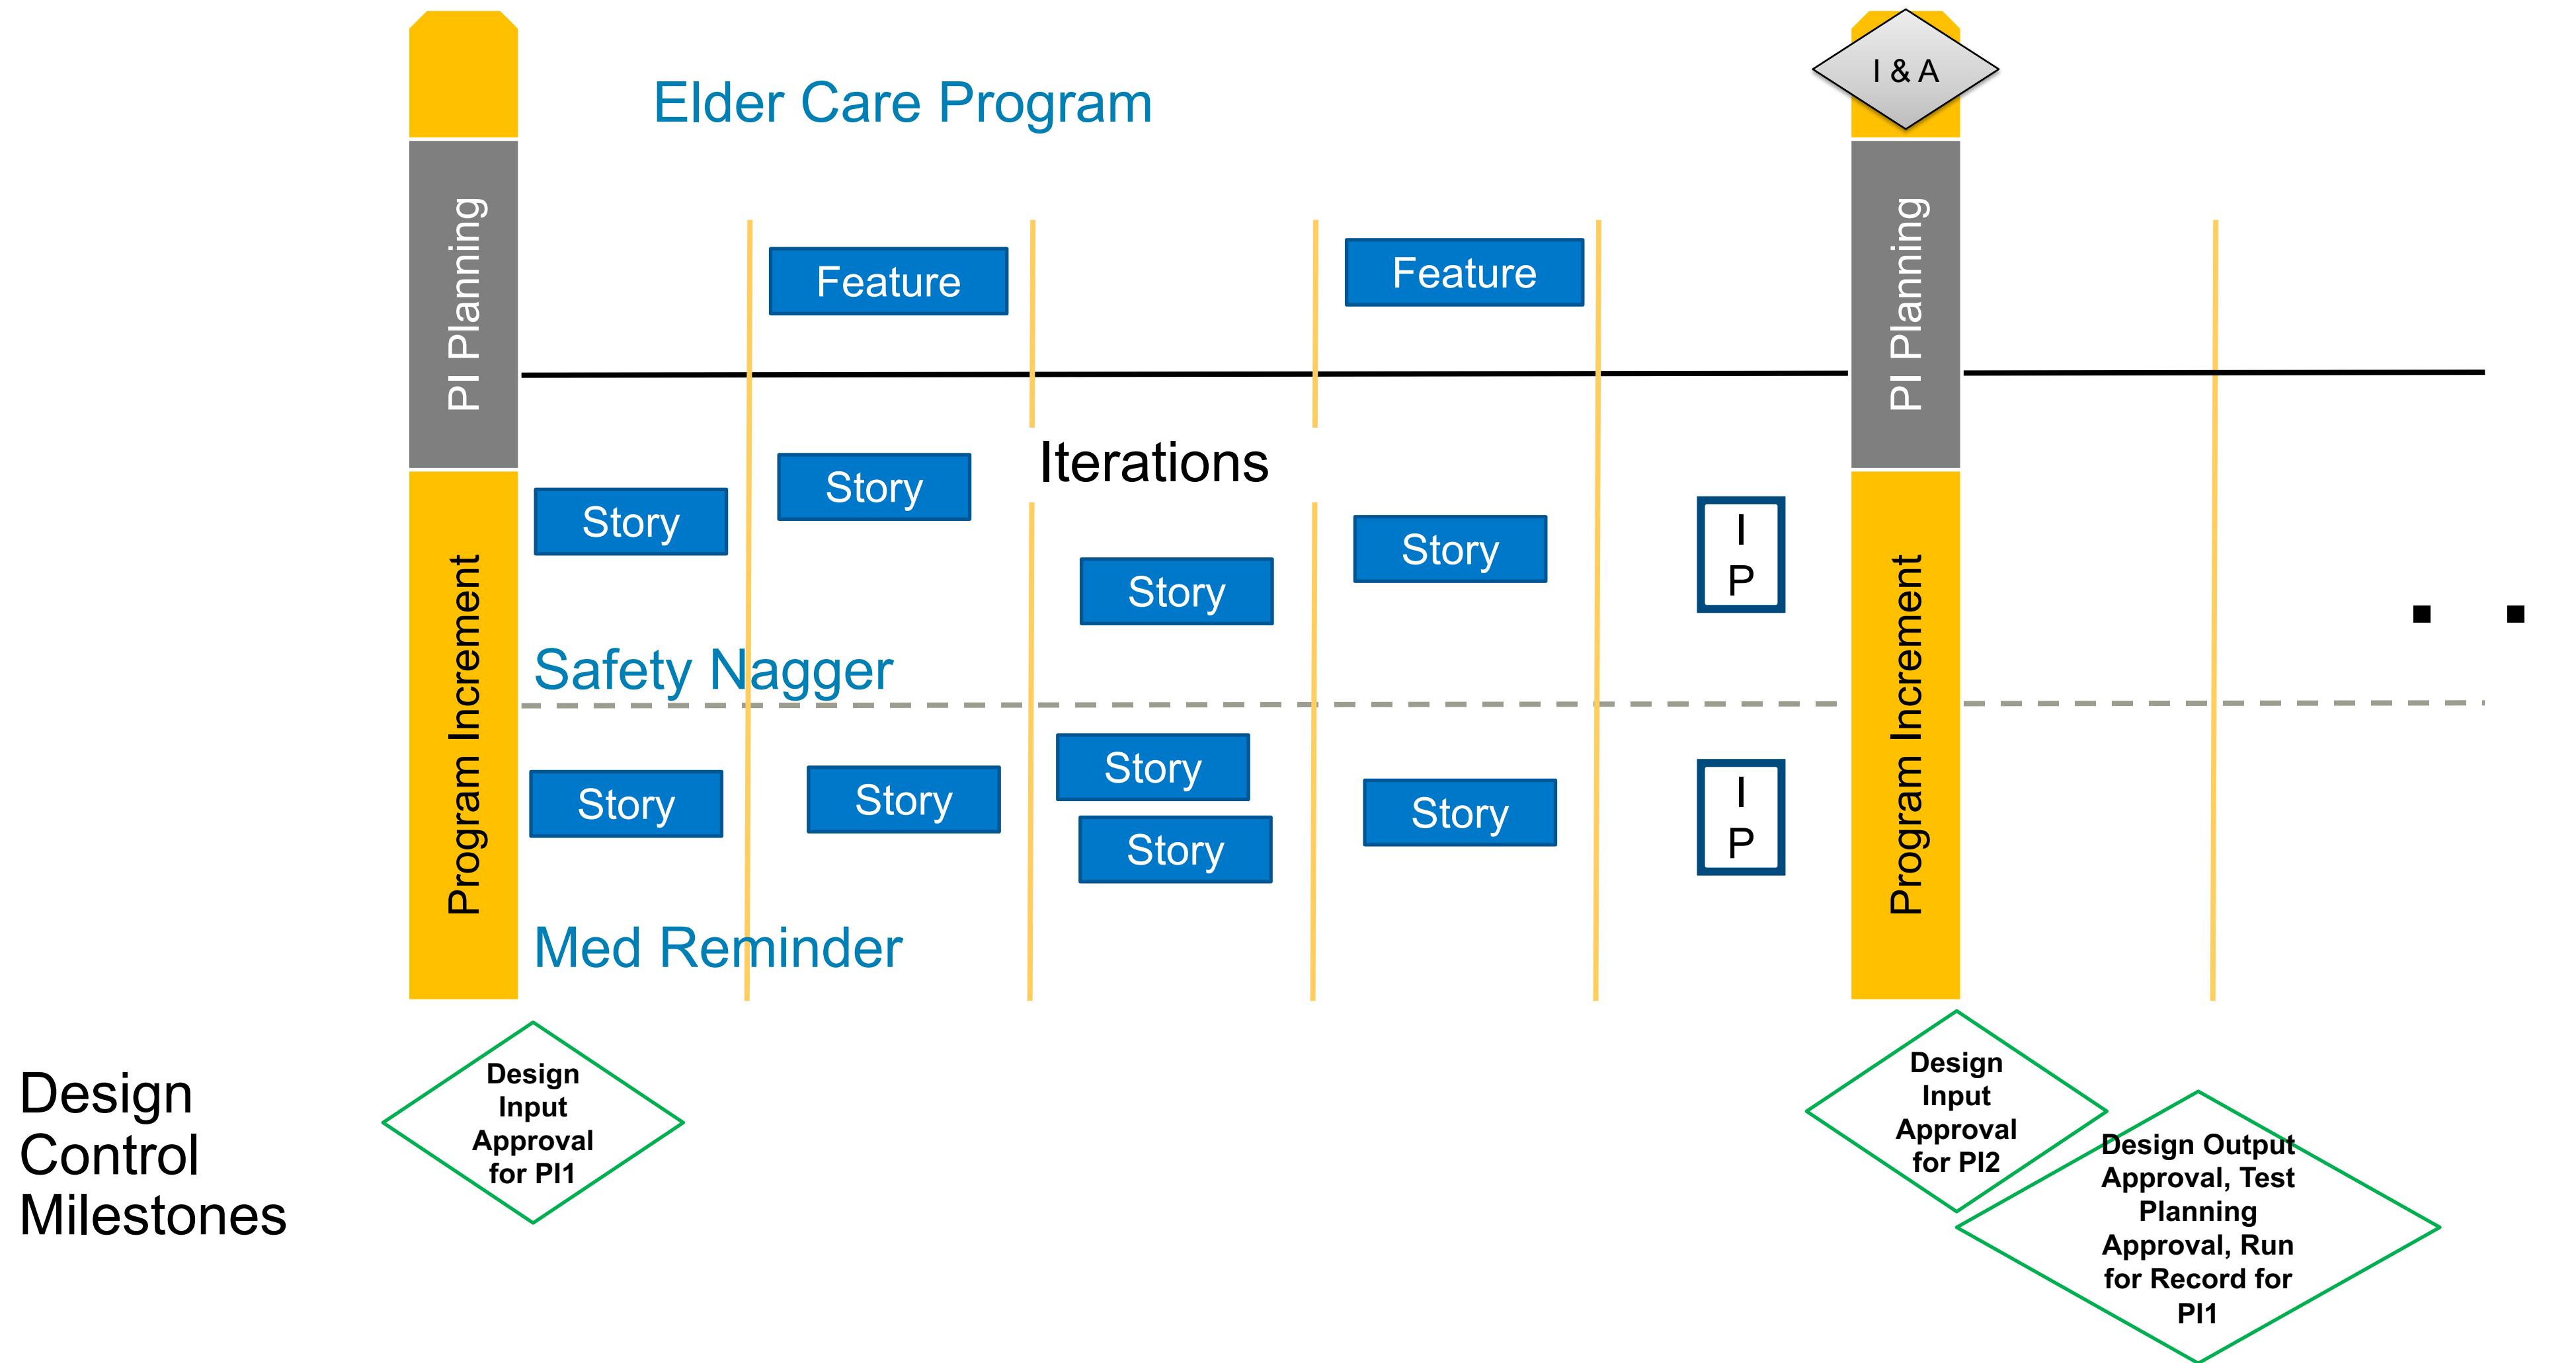

// **Don Reinertsen**

*Large batches
inherently lower
motivation and
urgency.*

Learning Batch vs Compliance Batch

For every Program increment, 13 weeks

Feedback Cycles – Economic Components

Leading indicators

Cost of intervention

Gold plating

Business value

Relative weighting

Dynamic goals vs static goals

Speed of learning

Locality of decisions

Colocation

Sense of control – cause and effect

Feedback speed

Decision cycle time

Problem aging

Turning radius

Capacity allocation

// Dantar Oosterwald, The Lean Machine

The primary cause for project failure is false positive feasibility.

...

Product development . . . is more dependent on what needs to be learned than on what tasks must be completed to exit a gate.

“Working software is the primary measure of progress” – the Agile Manifesto

// Don Reinertsen

*As delays get
longer the
damage done
by delay
becomes
geometrically
larger.*

Collaboration – Economic Components

Team elasticity

Skill development

Innovation

Reduced risk of late integration breakage

Focus on common goal, business value

Elekta Medical Radiotherapy

“

The main value that we have seen through the introduction of SAFe are:

Improved code quality already through Scrum

*The program execution provides cross site and cross function **collaboration**.*

*PI planning provides both vertical and horizontal **alignment**. Teams know what other teams are doing, **teams knows what business expect** and business what teams can deliver.*

Transparency through working in the same system and regular demonstrations.

*And agile estimates and planning drives **realistic long term planning**.*

// Don Reinertsen

*Operating a
product
development
process near full
utilization is an
economic disaster.*

Relentless Improvement – Economic Components

Problem aging

Enabler size trends

Cost to implement

Value of outcome

Motivation through ownership

Decentralization

Example – Centralized Tool Ownership

The image displays three side-by-side screenshots of a centralized tool interface, likely Jira, illustrating the creation and management of a project structure.

Left Screenshot (Epic Creation):

- Mandatory:**
 - Issue Type: Epic
 - Reporter: Seelbach, Michael
 - Epic Name: [JAZZ] RTC-Jira-CLM Pilot
 - EpicType: Feature
 - Summary: [JAZZ] RTC-Jira-CLM Pilot
 - Requesting Project: RD SW PROCESS IMPROVEMENT (DG-044168)
 - Description: Pilot to be defined. Teams, Solutions selected for piloting. Feedback from pilots to be received and follow-up actions to be defined. Documentation, training material to be updated.
 - Tool/Area: Other Tools
 - Component/s: JazzServer, Tools Front Desk
- Planning:** This tab is not visible in the screenshot.
- Others:** This tab is not visible in the screenshot.

Middle Screenshot (Feature Creation):

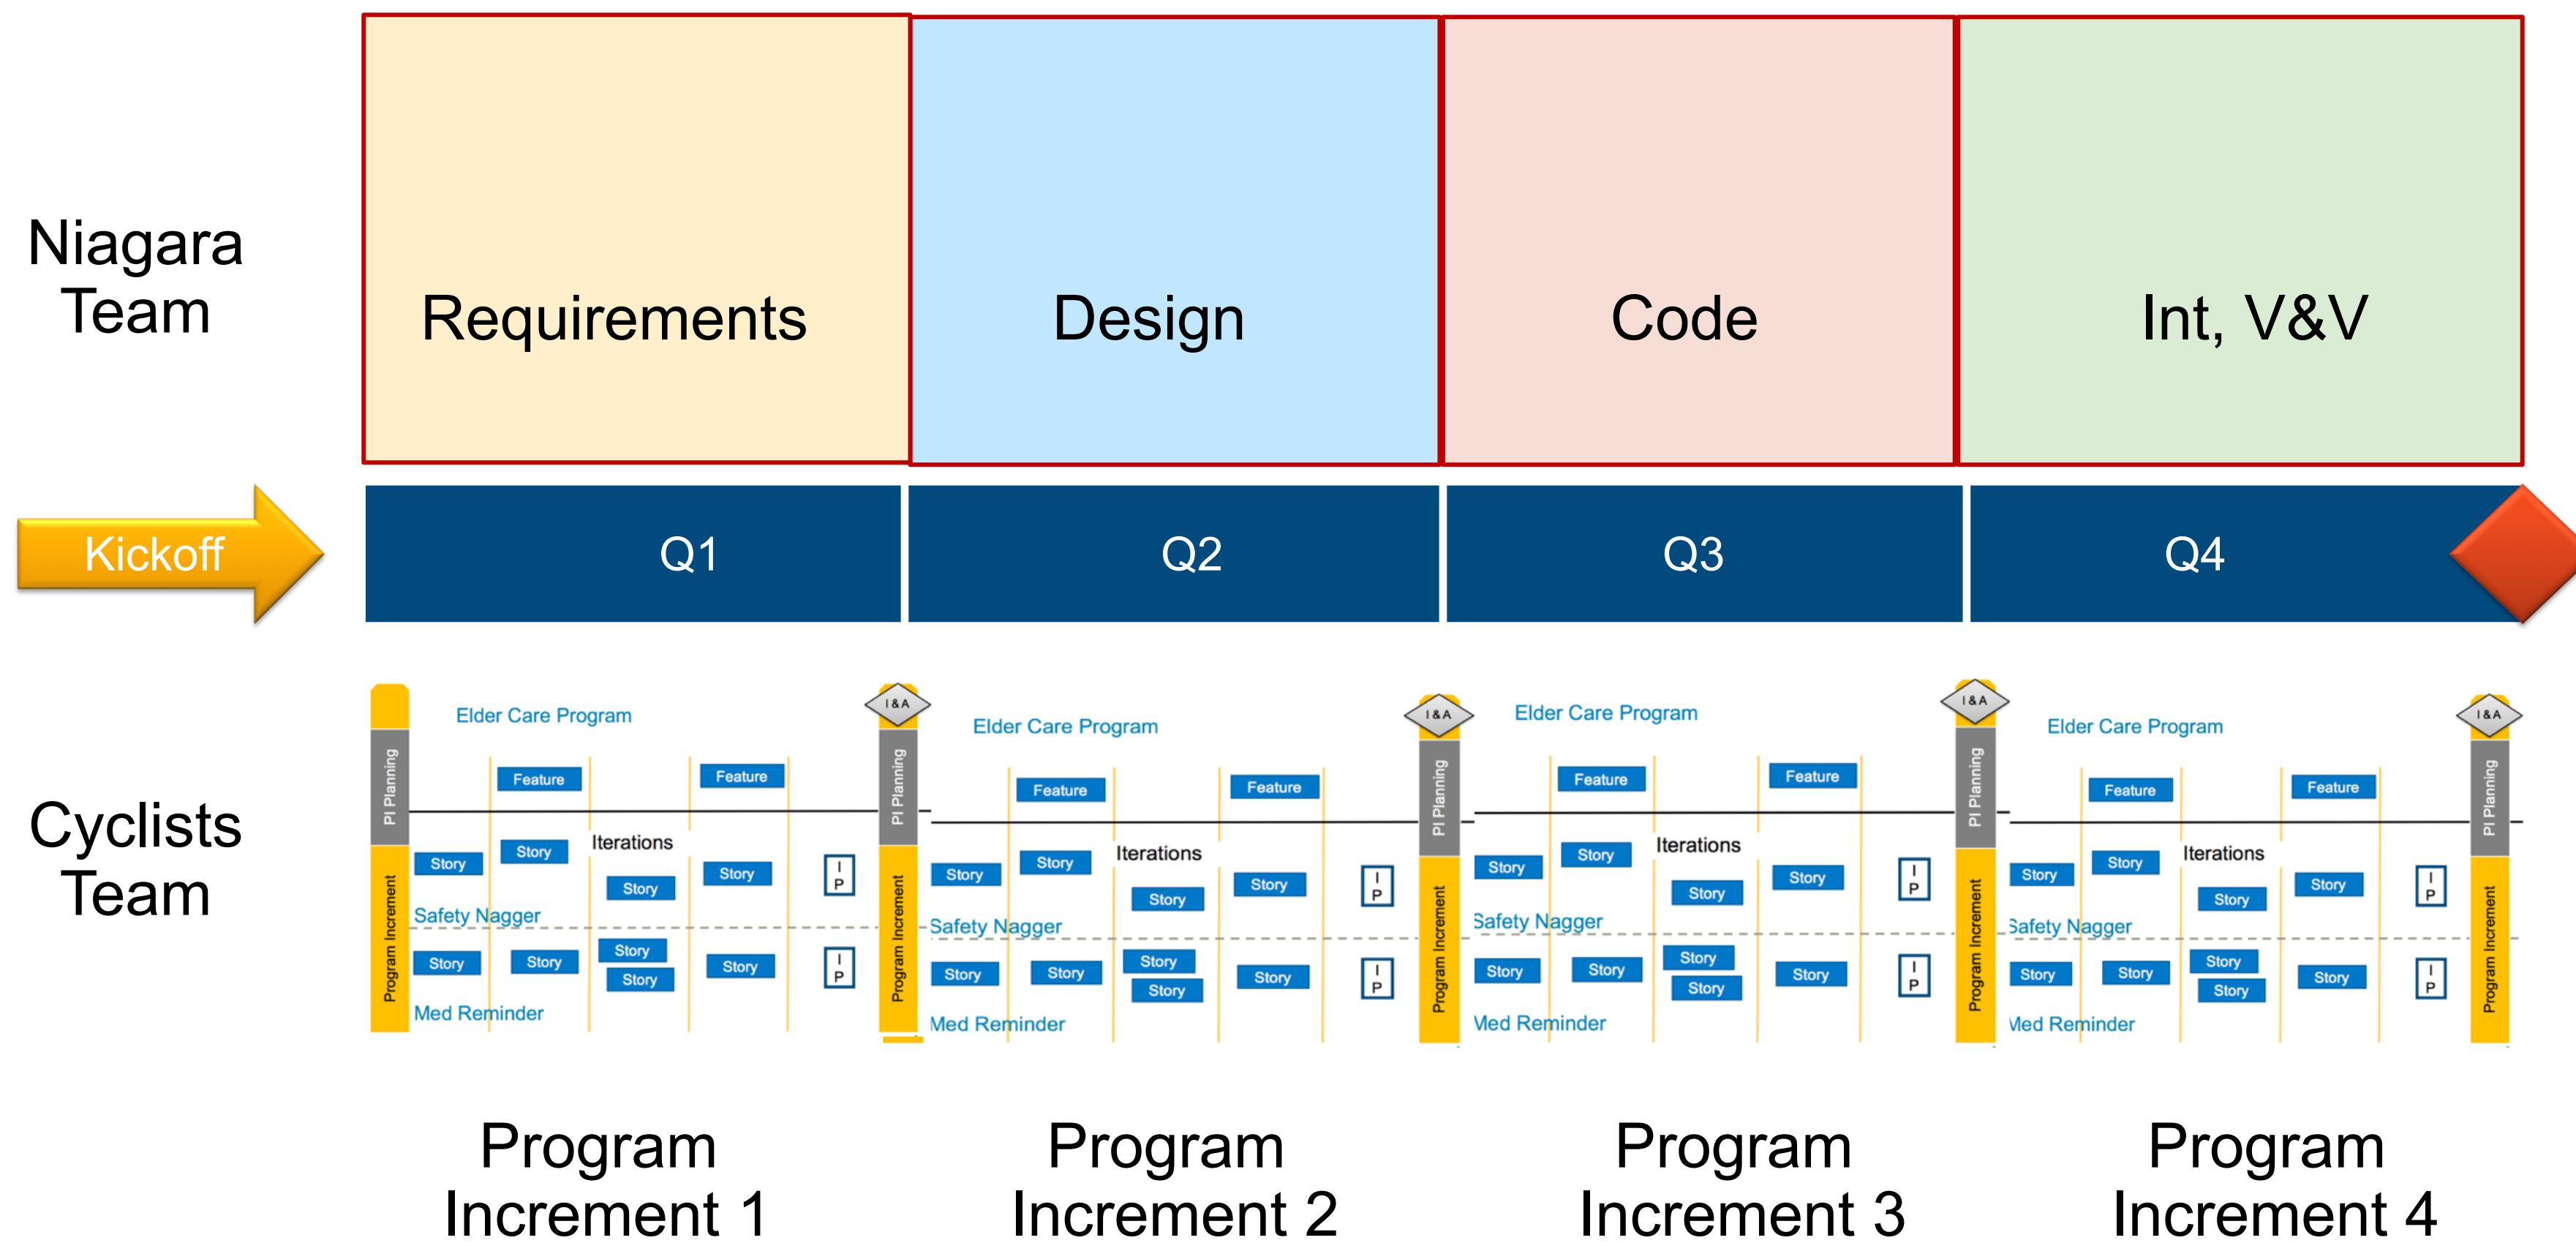

- Mandatory:**
 - Theme: (empty)
 - Priority: Minor
 - User-Business Value: 20
 - Time Criticality: 20
 - RR-OE Value: 13
 - Job Size: 5
 - Estimated Story Points: 14
 - Estimated Monetary Cost: (empty)
- Planning:**
 - BlockerDefinition: (empty)
 - Risk Reduction/Opportunity Enablement Value: (empty)
- Others:** This tab is not visible in the screenshot.

Right Screenshot (Story Creation):

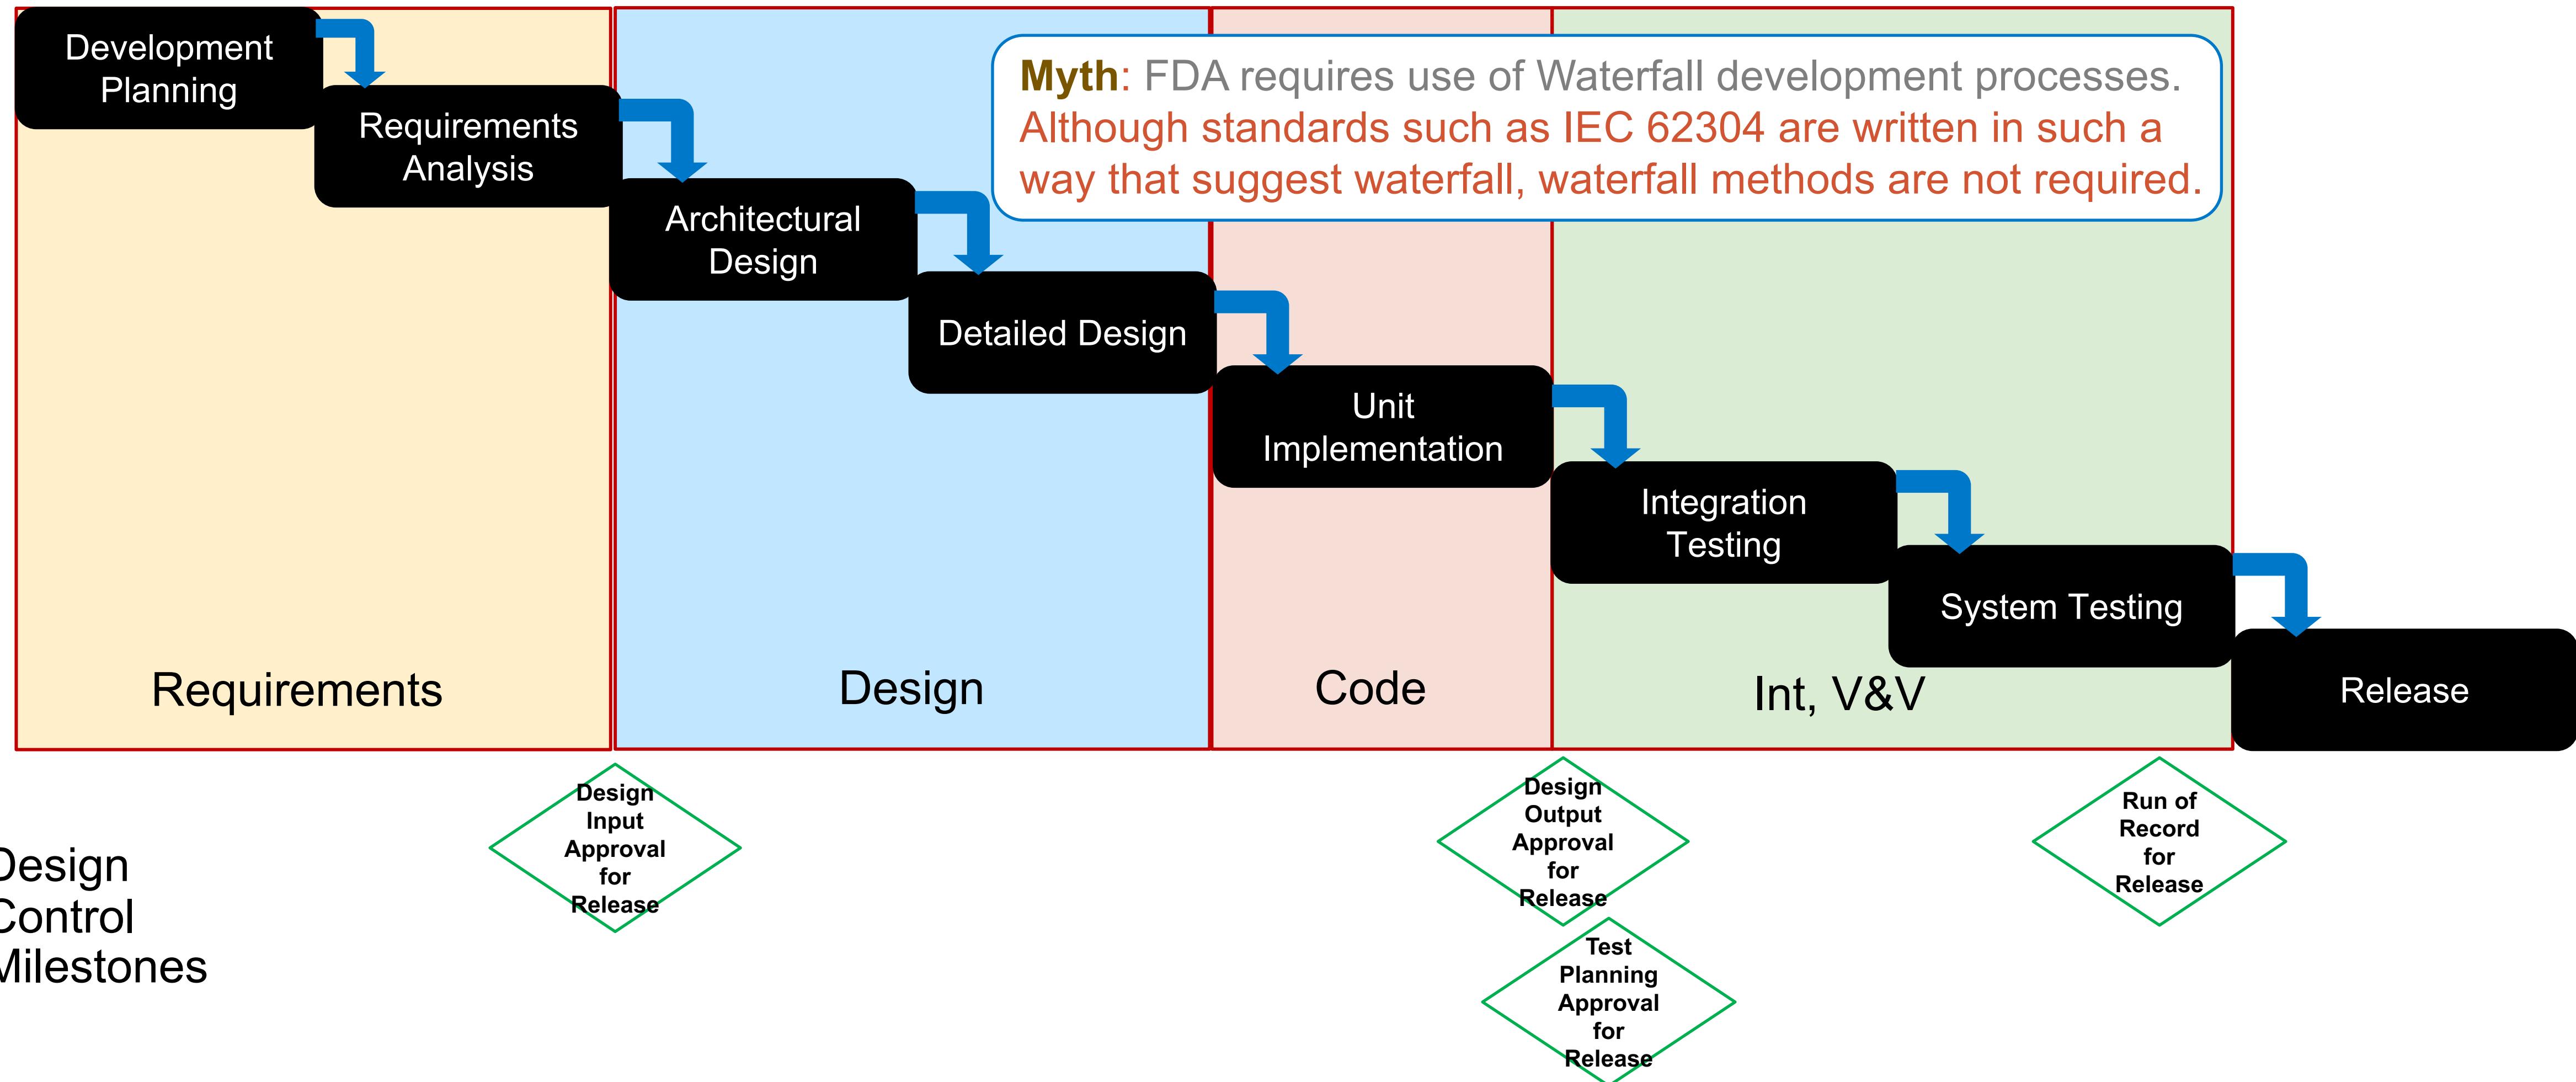

- Mandatory:**
 - Start Date: 19/Apr/18
 - Completion Date: (empty)
 - Fix Version/s: PI2 2018, PI2 2018 4
 - Team: PT ReCoMo
 - Sprint: PT-ReCoMo: 2/18_5 19.06-02.07
 - Story Points: (empty)
 - Assignee: Mattran, Mary
 - DoD: 0/1
 - PO Approved:
- Planning:**
 - Type item here and press enter
 - Definition of Done checklist for Projects: (empty)
- Others:** This tab is not visible in the screenshot.

A Tale of Two Systems

Timeline and Milestones

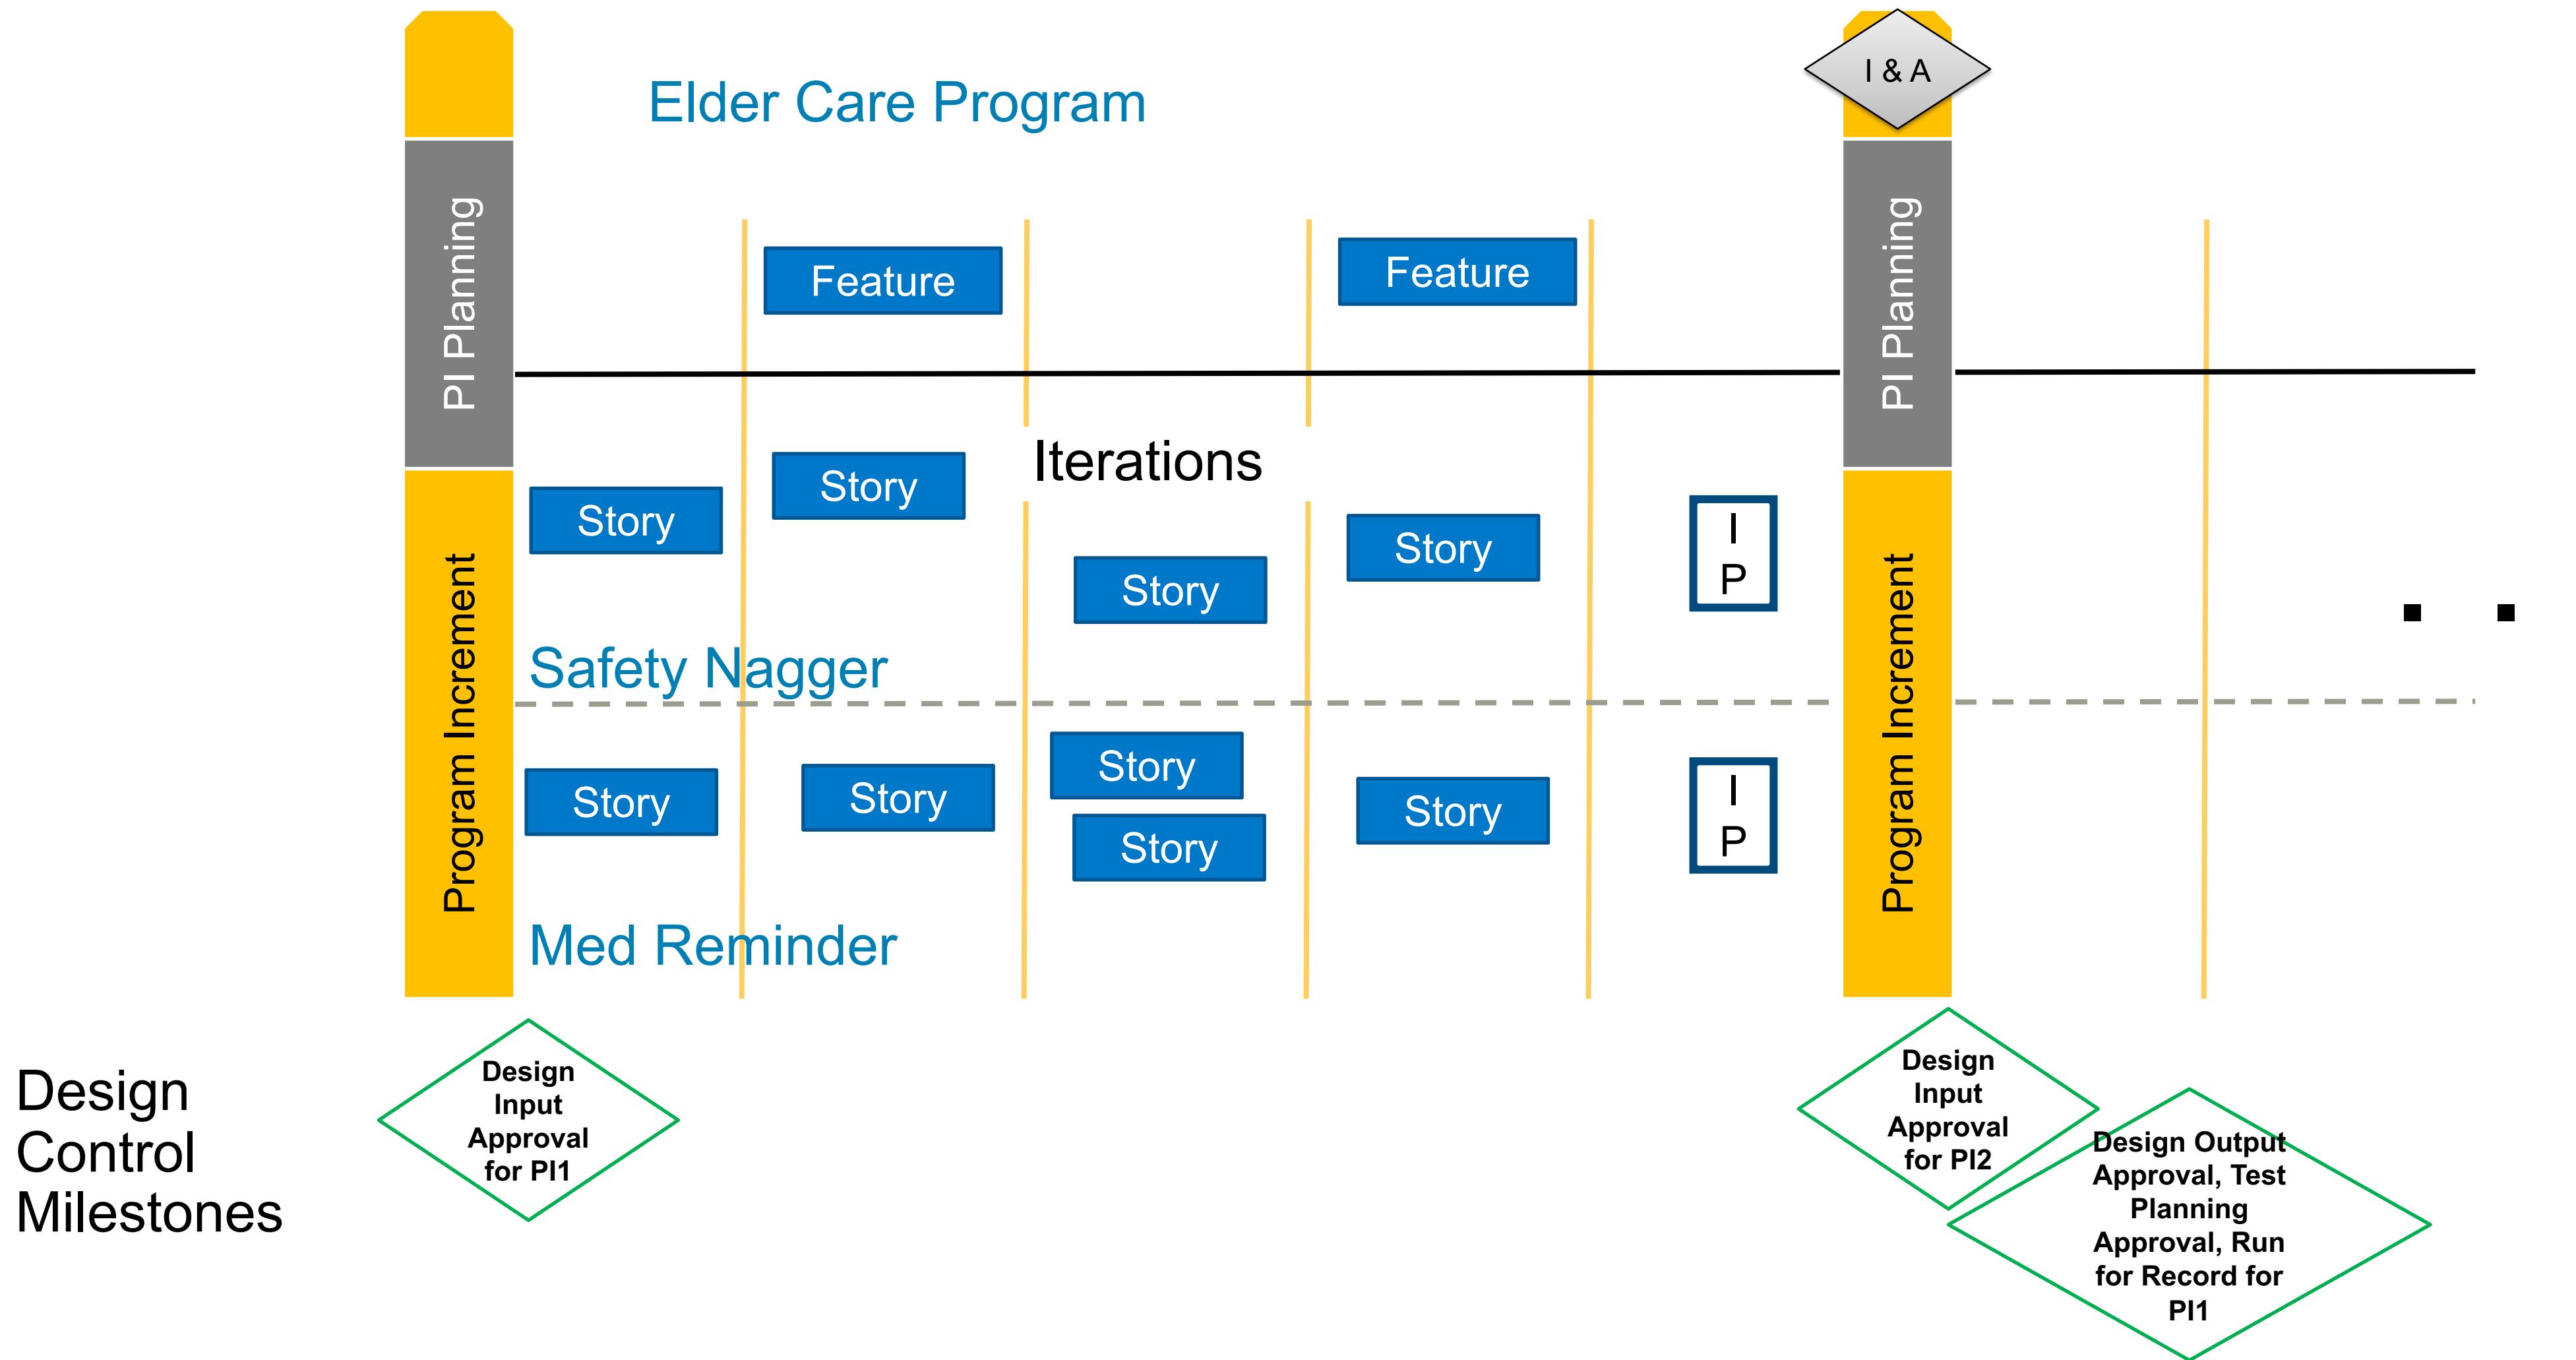

Niagara Team's Process

Cyclists Team's Process

For every Program increment, 13 weeks

Value Formulas

Progress Points = System Progress – Rework + Learning Boost

Progress in a domain (Pr) = % system built x “provenness”

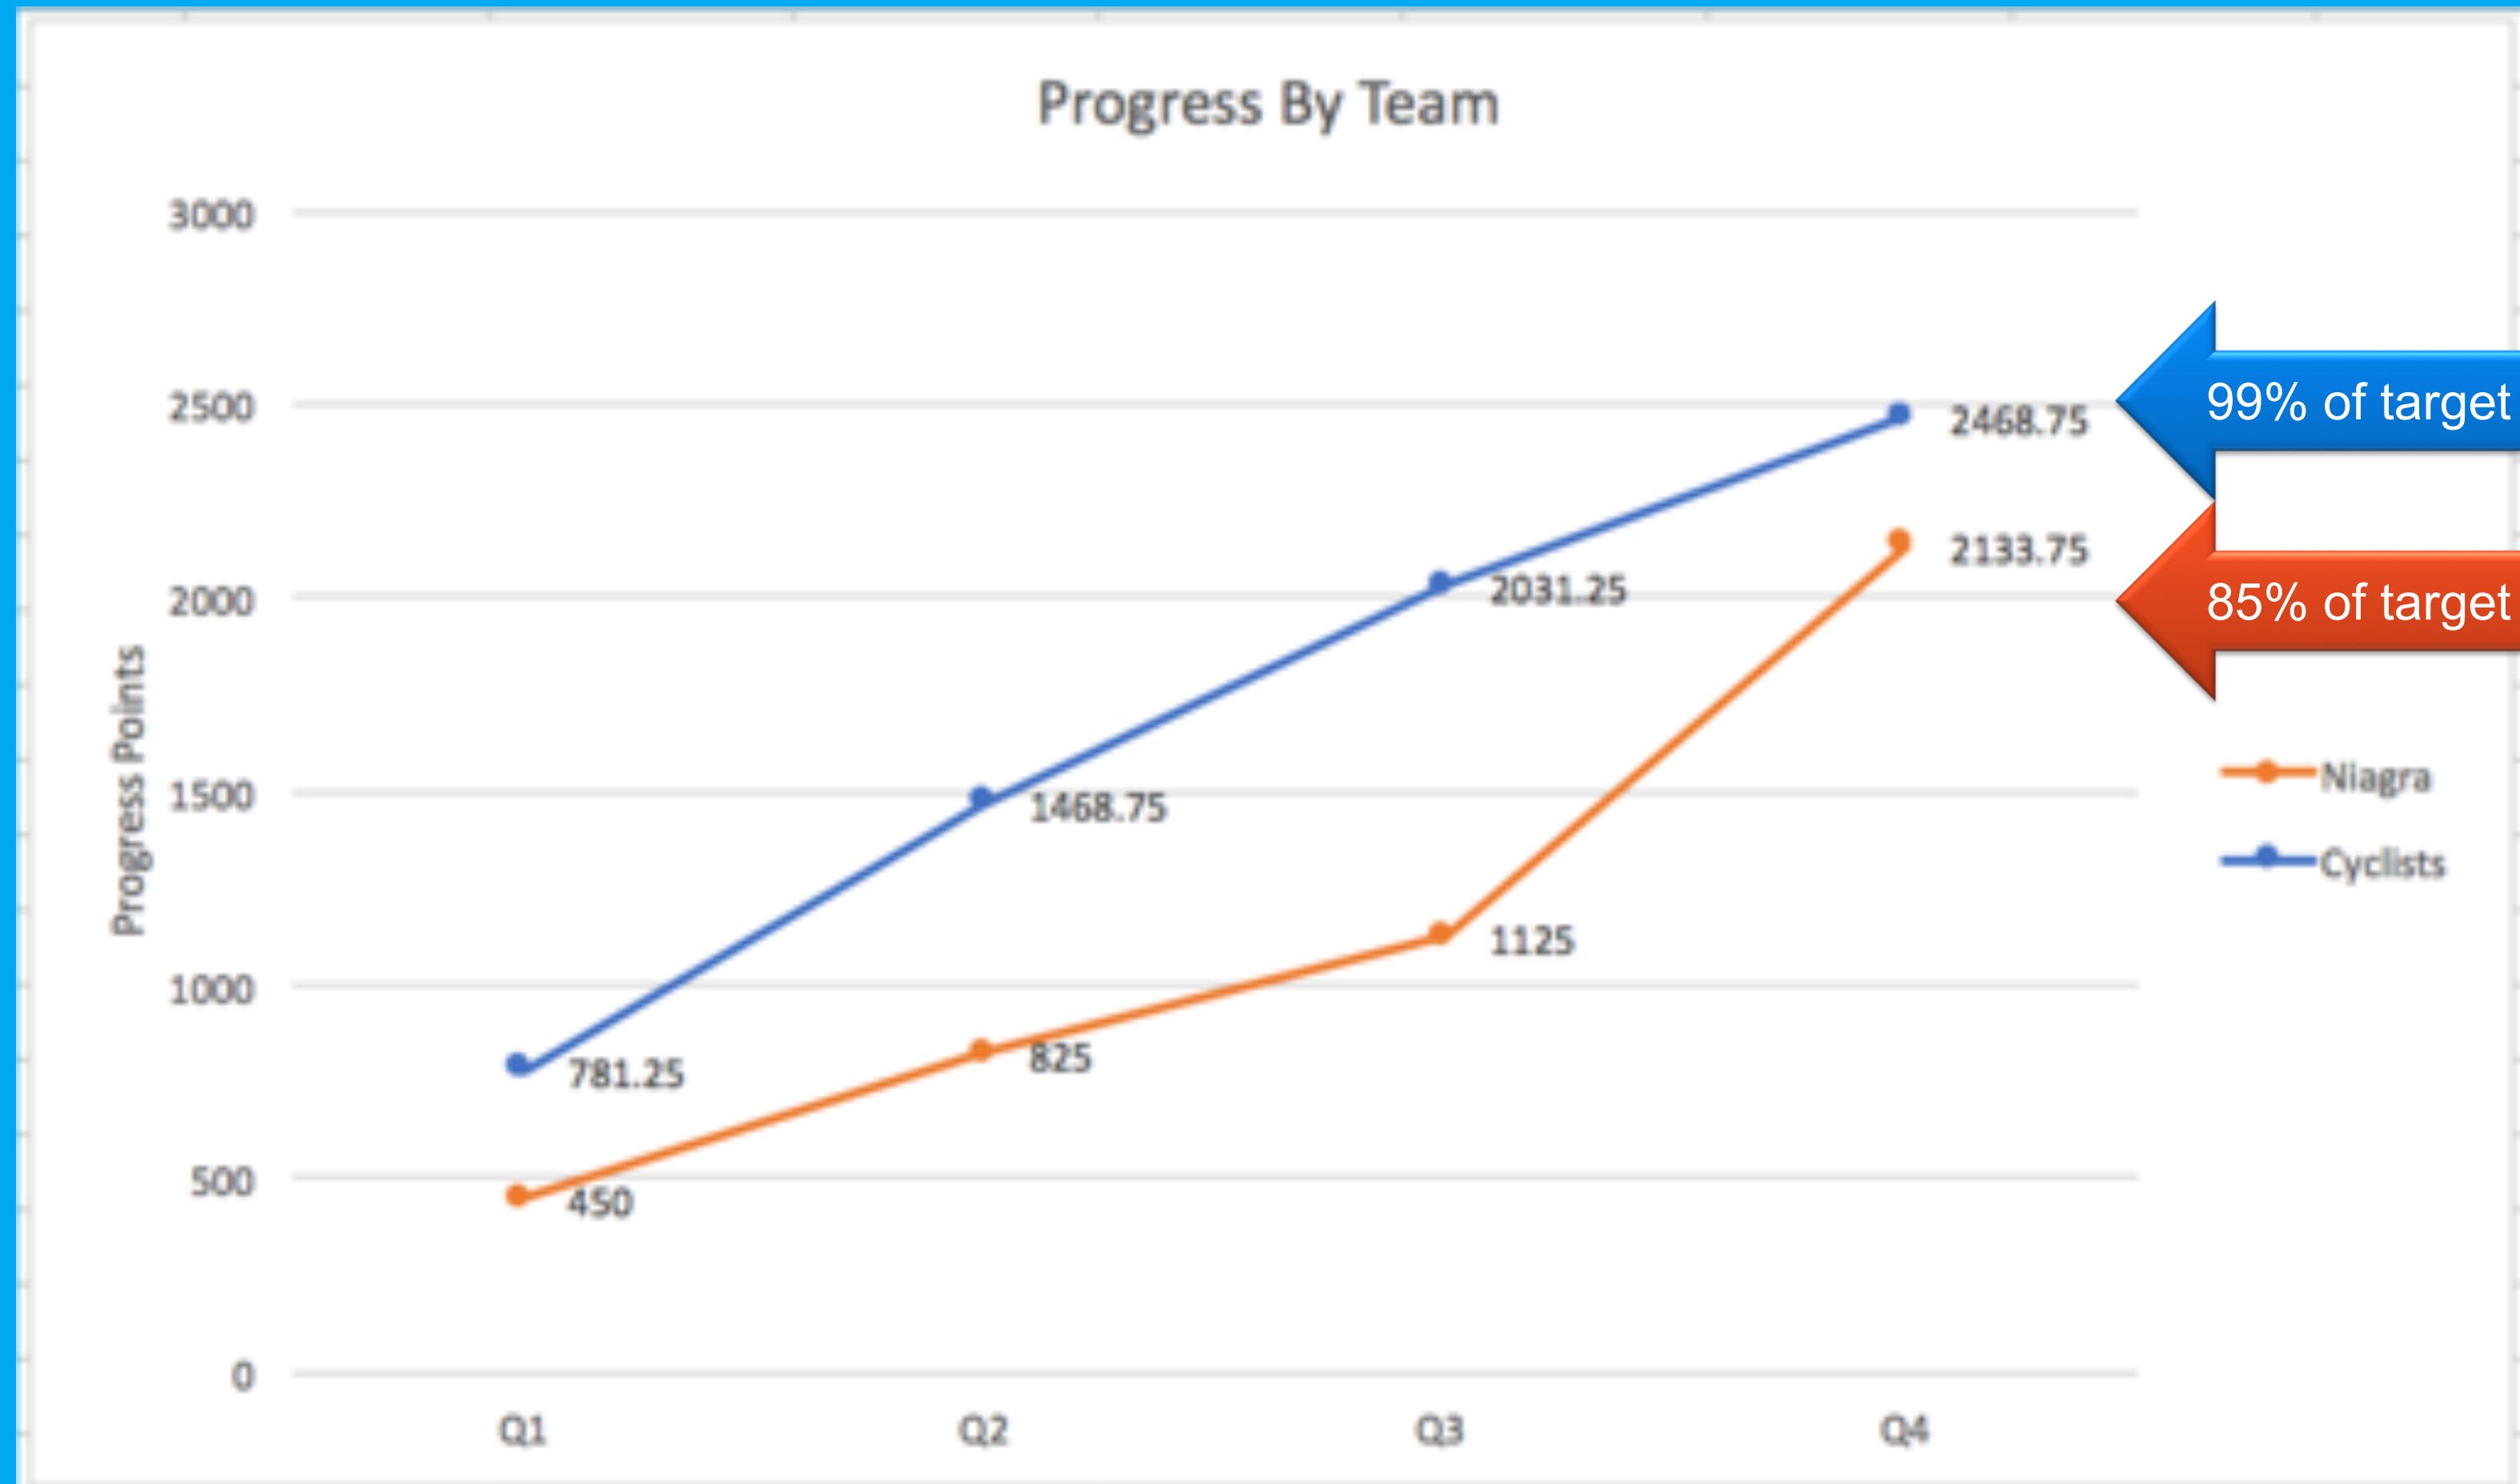

System Progress =

Pr(Requirements)+Pr(Design)+Pr(Code)+Pr(Int, V&V)+Pr(Risks)

Rework/fix effort = % system proven in current cycle x .05

Learning boost = (% system proven x .1) x (% schedule remaining)

Let's Compare Progress

// Dantar Oosterwald, The Lean Machine

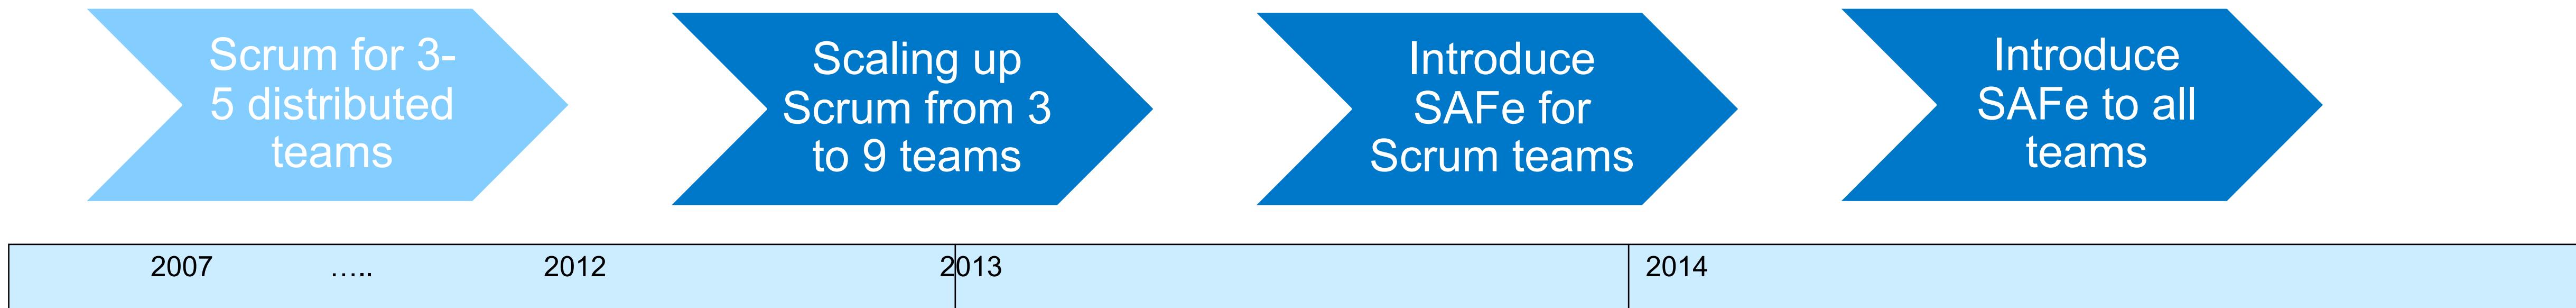

Photo by [Daniel Tausis](#) on [Unsplash](#)

A firefighting organization requires extraordinary people to achieve ordinary results. In an exceptional organization, ordinary people achieve extraordinary results routinely.

Practical Transformation Roadmaps

Historical overview of our Agile Transformation

- + Increased our throughput
- + Deliverables at every sprint
- + Escalated any issues much sooner
- + Allowed agility during development (features)
- + Team could focus on one project
- + Overall happy teams

- Insufficient work on design and architecture
- Silos between scrum teams
- Dependency and integration issues
- Unclear overall objectives & plan
- Lack of visibility of the big picture
- Scrum of scrum not being effective

New to Agile Implementation Plan

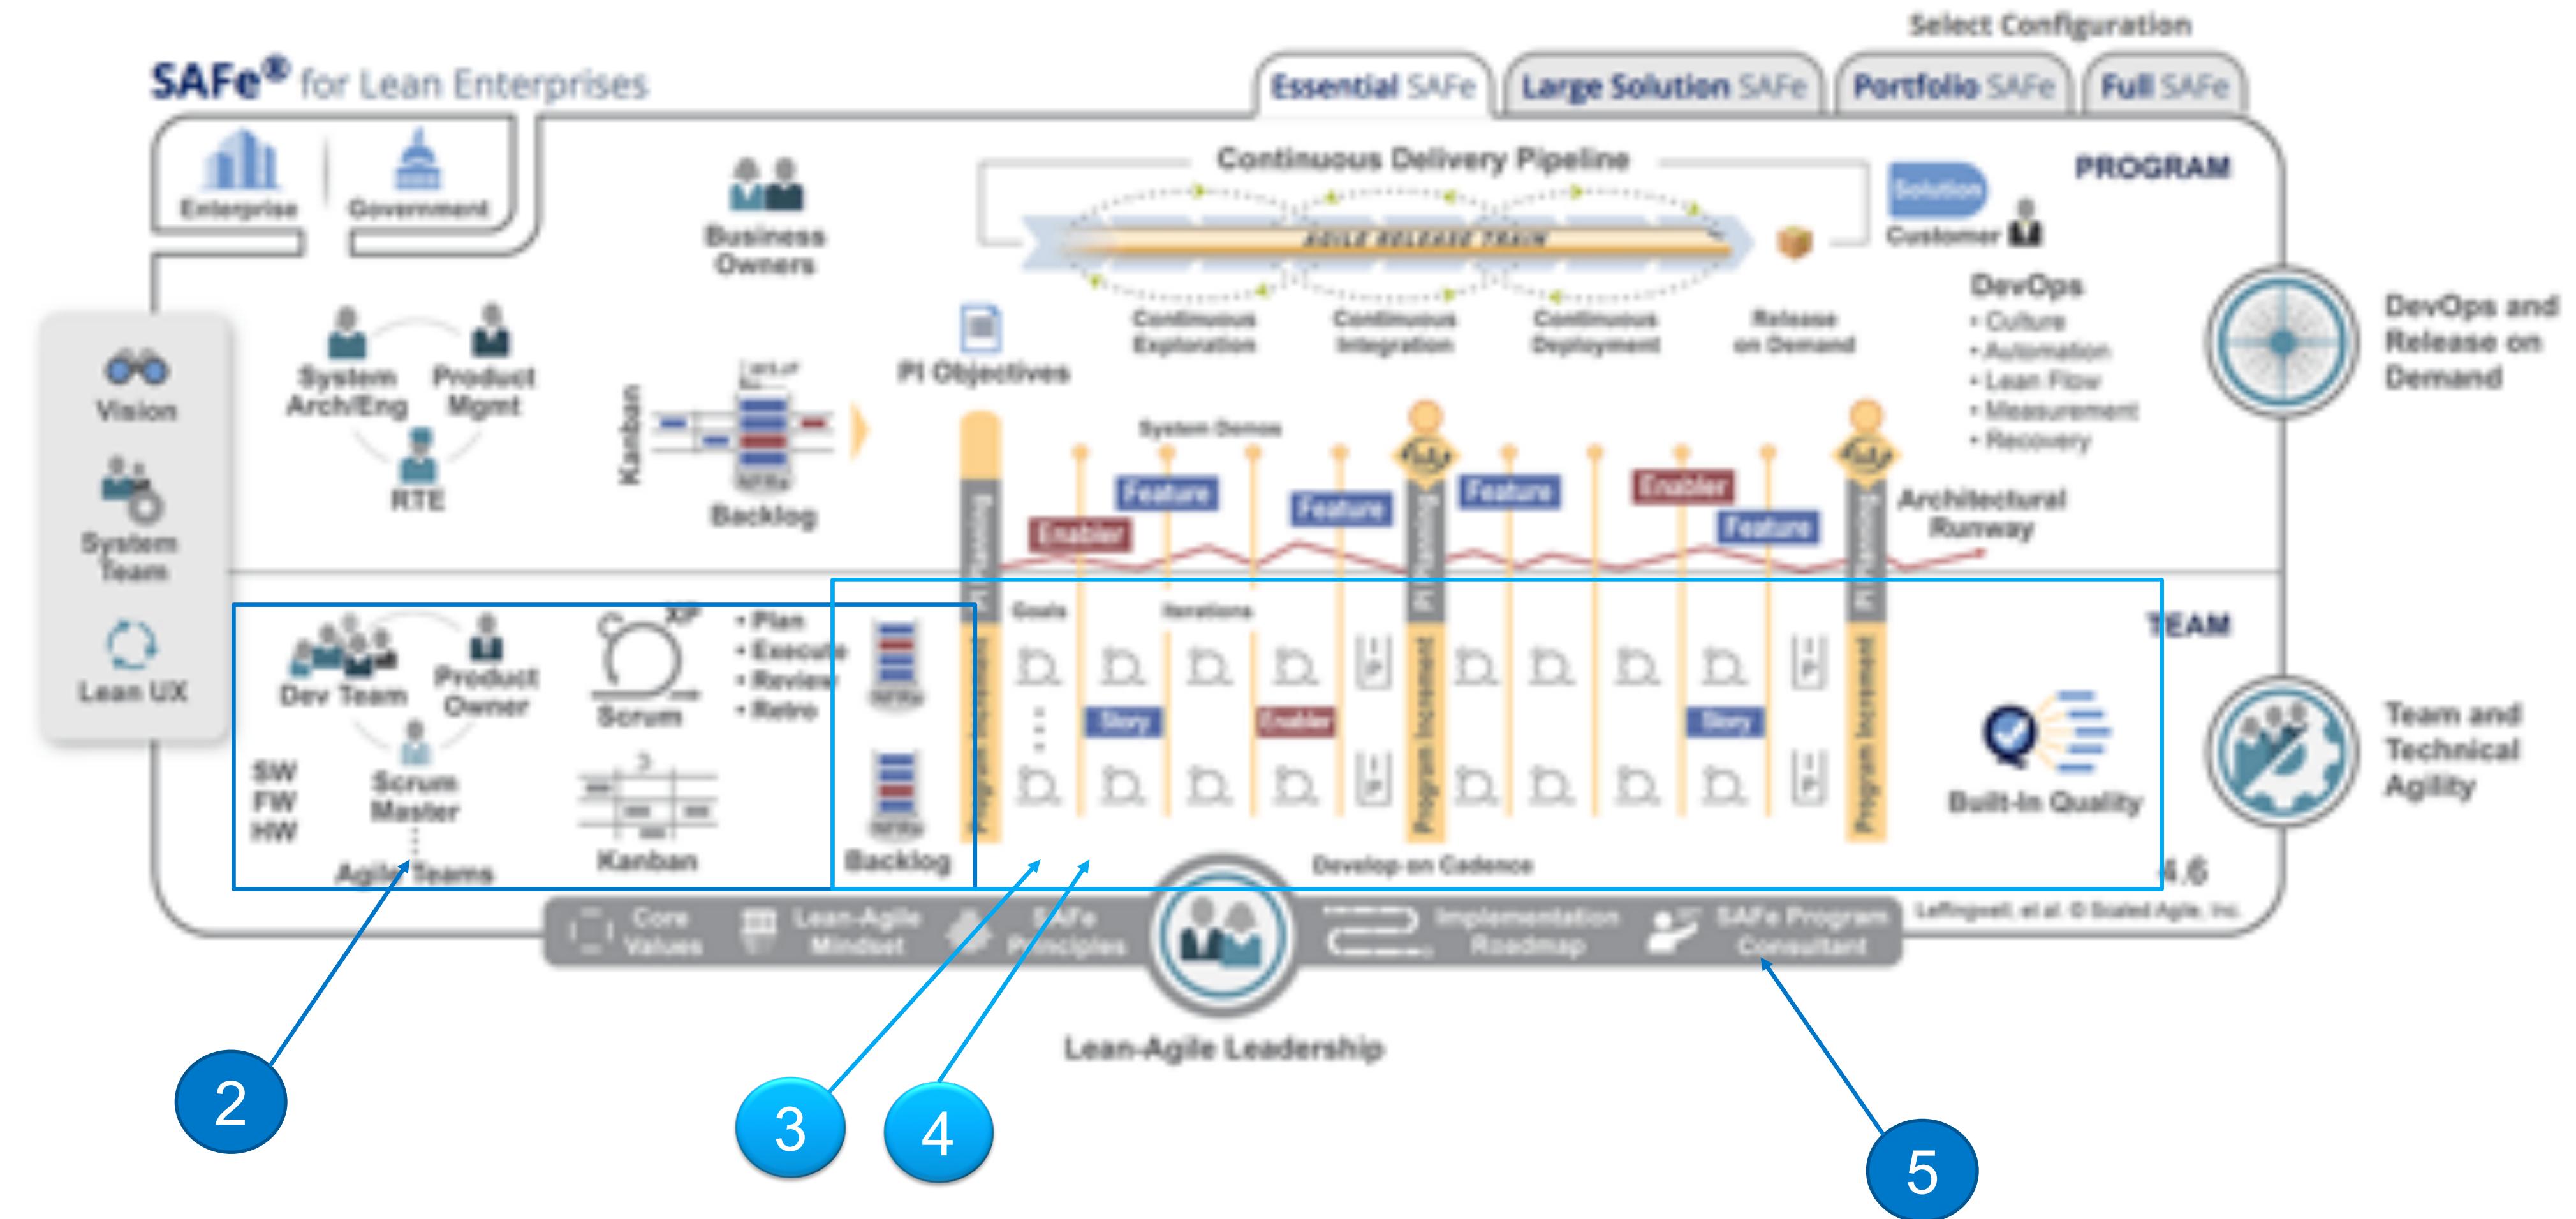

#	Name	Days	Notes
1	Leading SAFe Class	2	2-day class for executive sponsors, key roles in the organization. Standard Scaled Agile class with custom Program Increment Planning Simulation. https://321gang.com/services/leading-safe-with-safe-agilist-cert/#1541513088587-d71bfa56-49db
2	Scrum Bootcamp	2	2-day class to equip teams to work in an agile way. https://321gang.com/services/agile-scrum-boot-camp-simulation/
3	Patterns for Agile Hardware-inclusive Systems	1	https://321gang.com/services/patterns-for-agile-hardware-inclusive-systems/
4	Facilitating SAFe Systems Engineering Specification Workshop	1	http://www.321gang.com/services/agile-systems-engineering-workshop/#1541462075593-015f2eac-4e2c
5	Agile/SAFe Coaching	10	To be used as needed to help assist team and executive levels.

Implementation Roadmap – Strategic Thread

Implementation Roadmap – Tactical Thread

Essential SAFe 4.6

Your Economics Worksheet (handout)

Medical Device Value Stream – Economics Worksheet

Batch Sizes

Transaction cost

On average how long does it take to develop the software or firmware associated with a system requirement so that it is ready for independent* testing? _____ hrs/days/weeks/months (circle the time unit)

On average how long does it take to develop the hardware associated with a system requirement so that it is ready for independent* testing? _____ hrs/days/weeks/months (circle the time unit)

Holding Cost

On average how many Features or System Requirements are developed before they are tested in a fully-integrated system test? _____

What is the average time between when a system requirement or Feature is developed/built and when it is tested in a fully-integrated system test? _____ hrs/days/weeks/months (circle the time unit)

What is the longest time between when a system requirement or Feature is developed/built and when it is tested in a fully-integrated system test? _____ hrs/days/weeks/months (circle the time unit)

Risk

Qualify the risk of a misunderstanding of requirements propagating into multiple areas of the product. _____ low/medium/high (circle)

Motivation

Qualify the motivation of the product developers to act on critical feedback from stakeholders. _____ low/medium/high (circle)

Qualify the motivation of the product developers to suggest innovations based on their understanding of the product vision. _____ low/medium/high (circle)

Efficiency

Identify up to three bottlenecks in the current product delivery value stream:

- 1.
- 2.
- 3.

*Independent = outside the team that builds or develops it

** critical = significantly impacts usability or the business case of the product version
