Let's make stuff better!

Using human factors and qualitative
system analysis of healthcare systems
to identify opportunities
for medical device design

Hi, I'm Sam Alper!

Human factors and
industrial engineering

Deep research
background,
developed and
implemented
quantitative and
qualitative research
methods

Ph.D. in Industrial
and Systems
Engineering,
University of
Wisconsin -
Madison

[bōld] adj.

showing an ability to take risks; confident and courageous

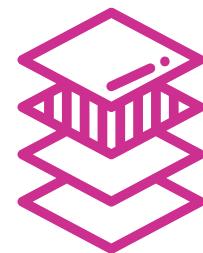

FULL-SERVICE UX RESEARCH AGENCY

Creative. Flexible. Research-minded.

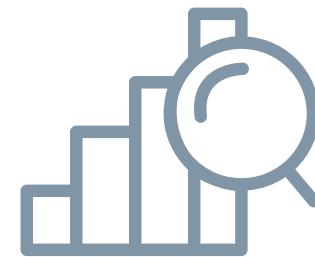

Explore

Understand the unmet needs
of your customers

Design & Refine

Get feedback early and often

Measure

Assess current state to focus
future development efforts

Self-Service for Patients.
Automated for Care Teams.
Great for the Bottom Line.

Patients and providers do better
together with Wellbe's
ConnectedCare™ solutions.

Wellbe delivers the digital solutions providers need to engage the connected consumer:

Guided Patient Navigation for Better Care Journeys

Automated Care to Scale Provider Productivity

Real-Time Insights from Patient-Generated Data

Wellbe wanted to:

- adapt their product to a new context**
- delight their client.**

QUALITATIVE DATA COLLECTION

Explore qualitative methods for rapidly gathering information that can inform design

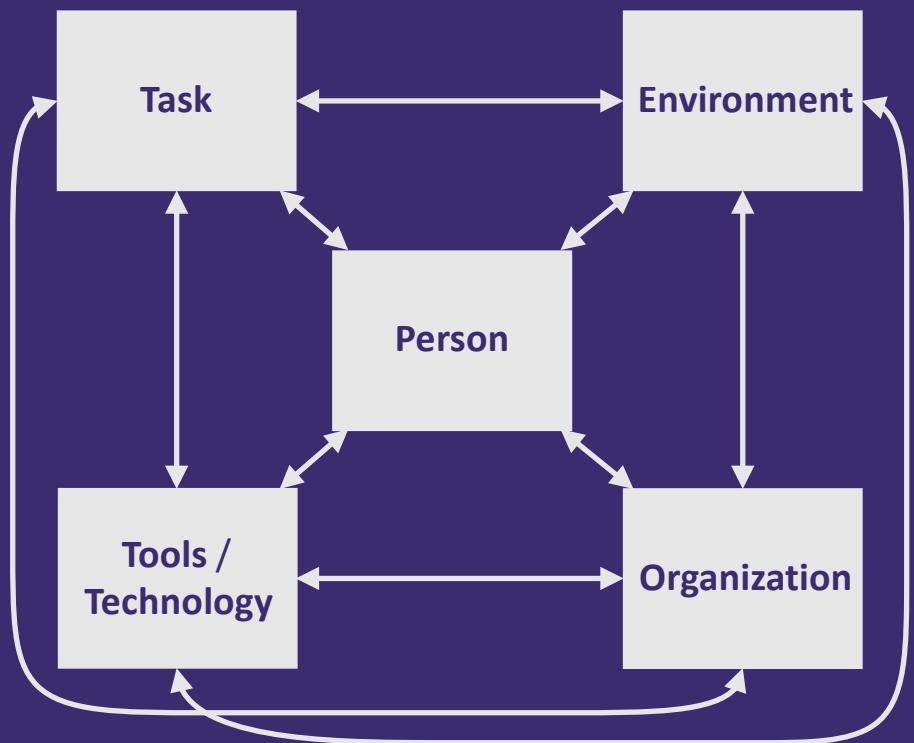

Improved system design

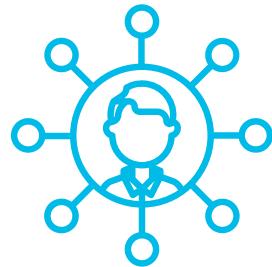

Improved device / tech design

WHAT SHOULD WE LOOK FOR WITHIN A SYSTEM?

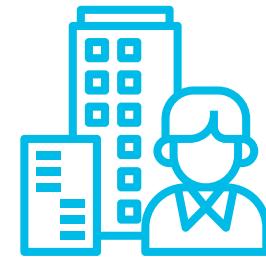

Smith, MJ and Sainfort, PC. (1989).
A balance theory of job design for
stress reduction. *International
Journal of Industrial Ergonomics*.
4(1): 67-79.

WHAT IS MACROERGONOMICS?

HUMAN FACTORS / ERGONOMICS

Concerned with the fit between people and the world they live in.

MACROERGONOMICS

A sub-discipline of Human Factors / Ergonomics that is concerned with the fit between people and the organizations of which they are a part.

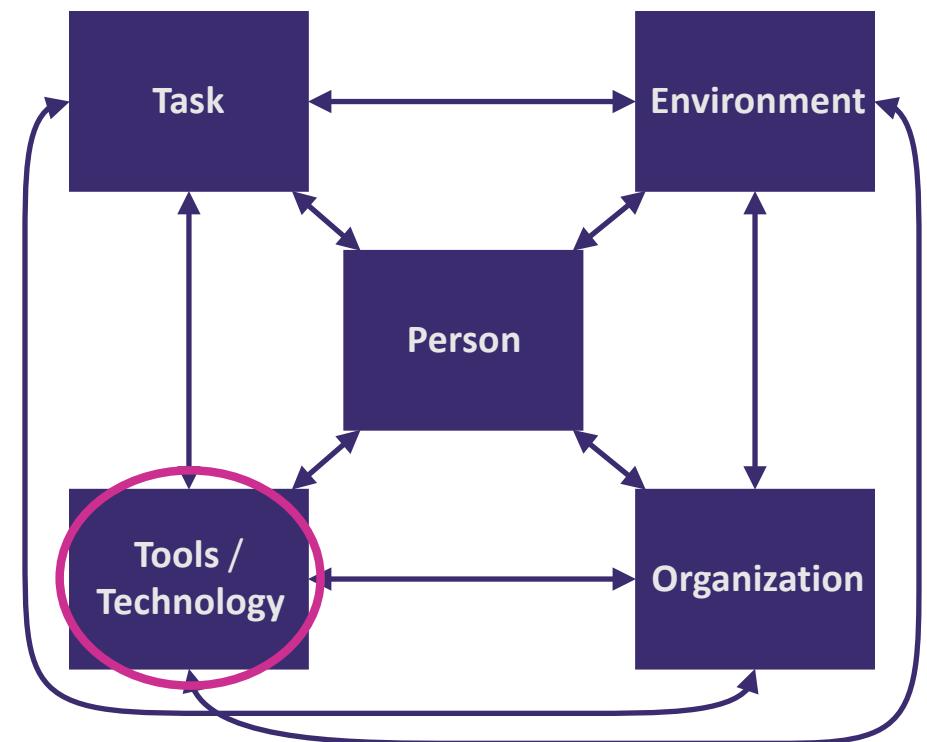

MACROERGONOMICS APPLICATIONS

Work system application

- Find gaps / challenges in work systems
- Determine methods to address those gaps / challenges

Device / tech design guidance

The same gaps / challenges in work systems may be addressed by introduction of a new device or technology

Observations

Enter an environment, record what you see, and experience

- Pros

- Gather *in situ* information; it's "real data"
- Get a feel for the environment
- Information-rich environment

- Cons

- Time required to get up to speed on the system / process
- See what presents itself
- Data recording issues
- May not be able to ask questions during observations
- Low-frequency events
- Capture bits and pieces of the same process multiple times
 - difficult to merge into coherent whole
- Time intensive!

Interviews

Question and answer session with an individual who is native to the environment

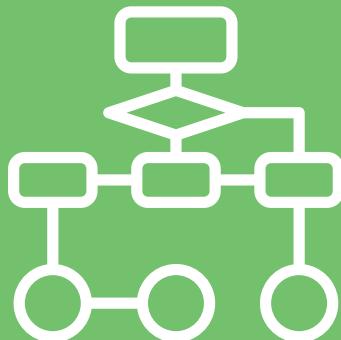

- Pros

- Can prepare questions in advance
- Ability to ask follow-up questions
- Increased control over the data collection

- Cons

- No information on items not asked about
- Lacks exposure to the “real” environment
- Difficult to keep up with the interviewee’s narrative speed

Flow-charting interviews

Collaboratively develop a flowchart in real time with the interviewee

- Pros

- Completeness of data collection is built into the process
- Speed of interview progresses at the speed the flowchart is built
- Information is organized in real time; data about different parts of the process can be put into the correct locations
- Information is validated in real time by the interviewee
- Gathers a great deal of process information quickly
- Identification of gaps
- Allows “foreshadowing” or “feedforward”

- Cons

- Time consuming to take flowcharts from “first pass” to “edited and ready to share”
- If not asked for, non-process factors may be omitted
- Requires interviewer to be comfortable following the flow of the interview

Methodology

- Flow charting interviews
- Observations
- Further flow charting interviews
- Analyze and aggregate data and put together into “clean” flowcharts
- Examine flowcharts for gaps, challenges, safety issues, opportunities for error, opportunities for improvement

Identifying gaps in healthcare

Inform technology design

Work with Wellbe

- Goal to inform the design of Wellbe's product
 - How would Wellbe's solution fit into a new space?
 - What opportunities?
 - What challenges?
 - How can Wellbe gain buy-in?
- Hybrid of flowcharting interviews and observations with staff
 - Two days in clinic
 - One day in surgery center

Other applications

- Healthcare processes
 - Hospital units
 - E.g., General medical surgical, oncology / hematology, NICU, PICU
 - Pharmacies
 - Surgery centers
- Spray foam installation
- Financial advisors
- Sales team's sales process
- Website development company
- Attorneys
- Sandwich shop
- ... and more

Spray foam installation

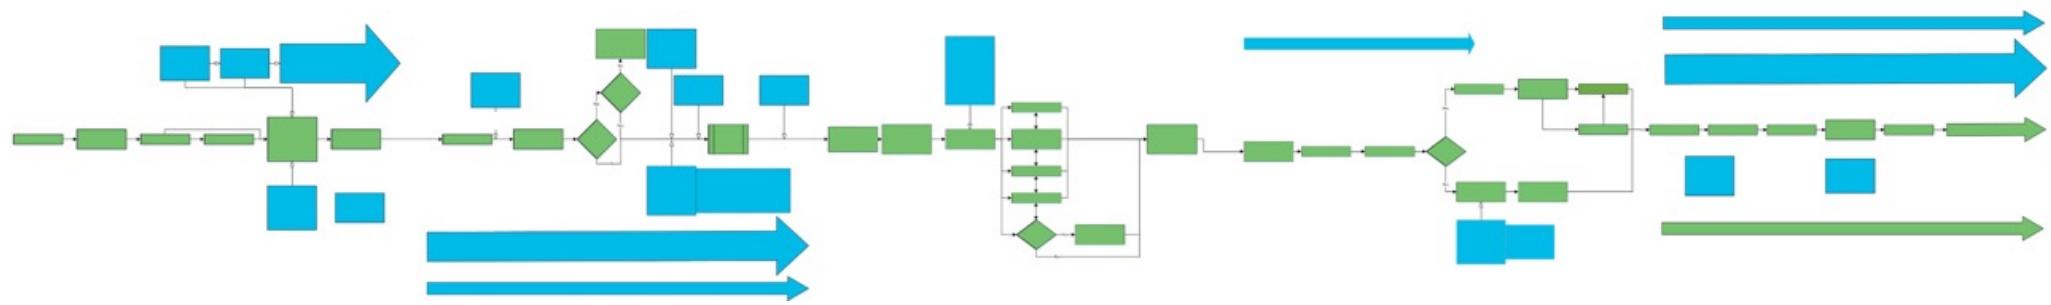

Address quality problems

- Quality issues: Re-work was required for >50% of their projects
- Engaged in a process review with project manager using flowcharting interviewing
 - (2) 2-hour sessions
 - Focused on the beginning and end of the process
- Identified human factors issue related to quality checking processes
 - Resulted in a new device to increase quality for the company
