

A systems approach to architect coherent system-of-systems (SoS) capabilities

*Yeoh Lean Weng and Chia Ban Seng
Defence Science and Technology Agency
Singapore*

~ A Presentation for INCOSE 2010 ~

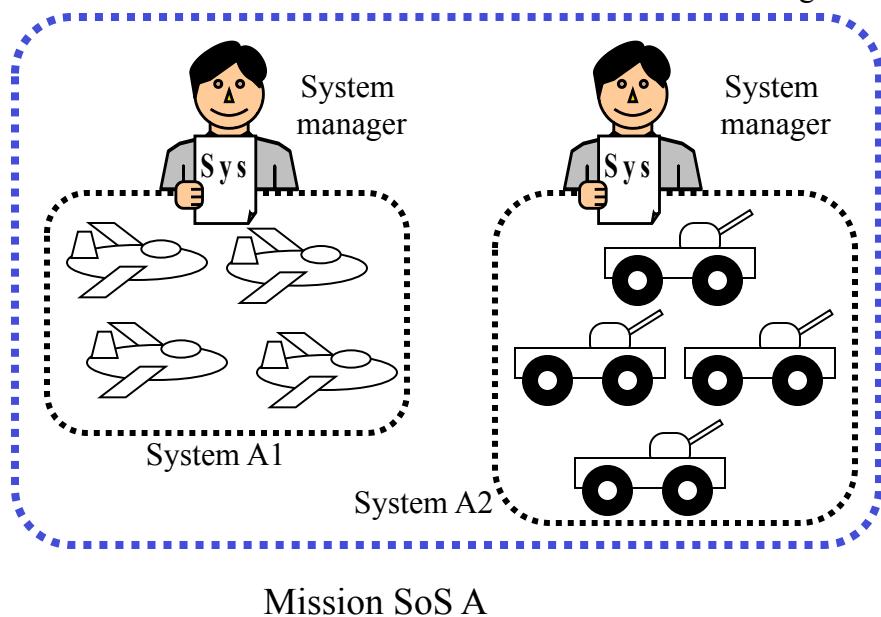

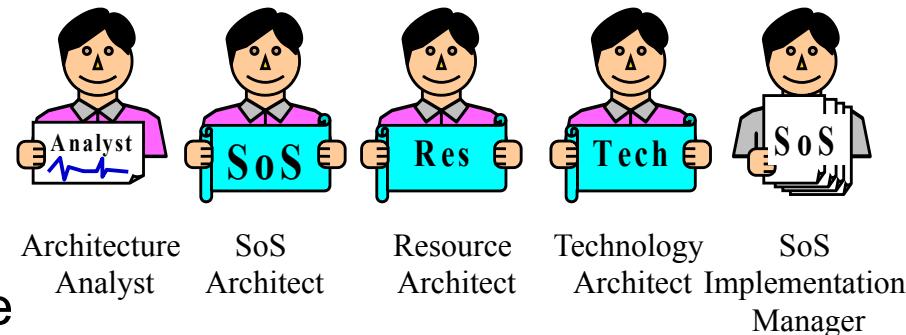

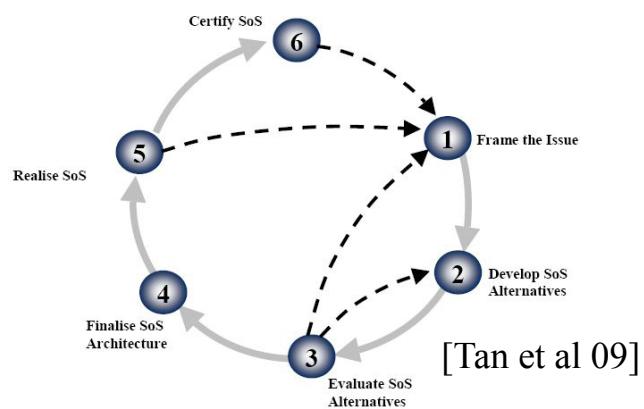

Key Ideas & Terminology in Paper

- Architecting integrated mission capabilities for an SoS (**Mission SoS**)
 - context of defence and national security
- Impetus to attain “global optimum” in SoS
 - instead of “local optimum”
- Coherent use of limited non-scalable resources (**Enterprise Resources**) by various Mission SoS
- Some level of commonality and synergy in scalable tech solutions (**Enterprise Technology**) across various Mission SoS

Key Ideas & Terminology in Paper

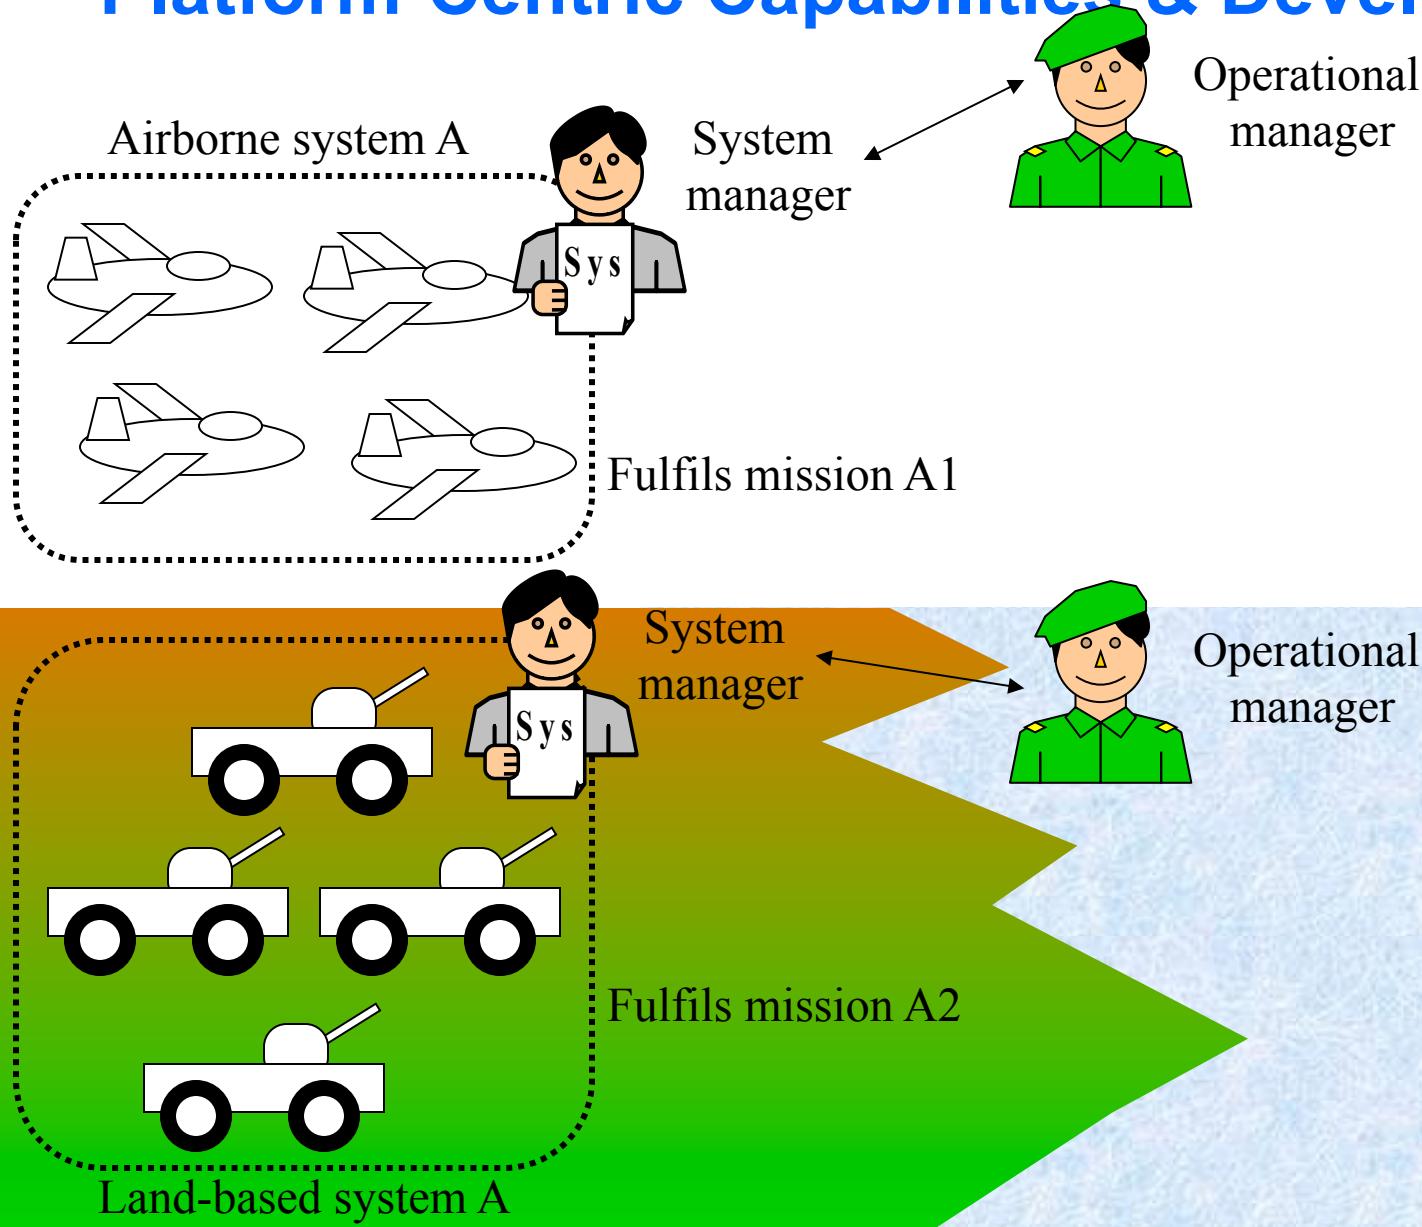

- Technical organization structure
 - Assumption: “Top-down” leadership approach is applicable
 - Higher level technical authorities that oversee system managers
- Broad process for architecting

How I Will Present the Key Ideas

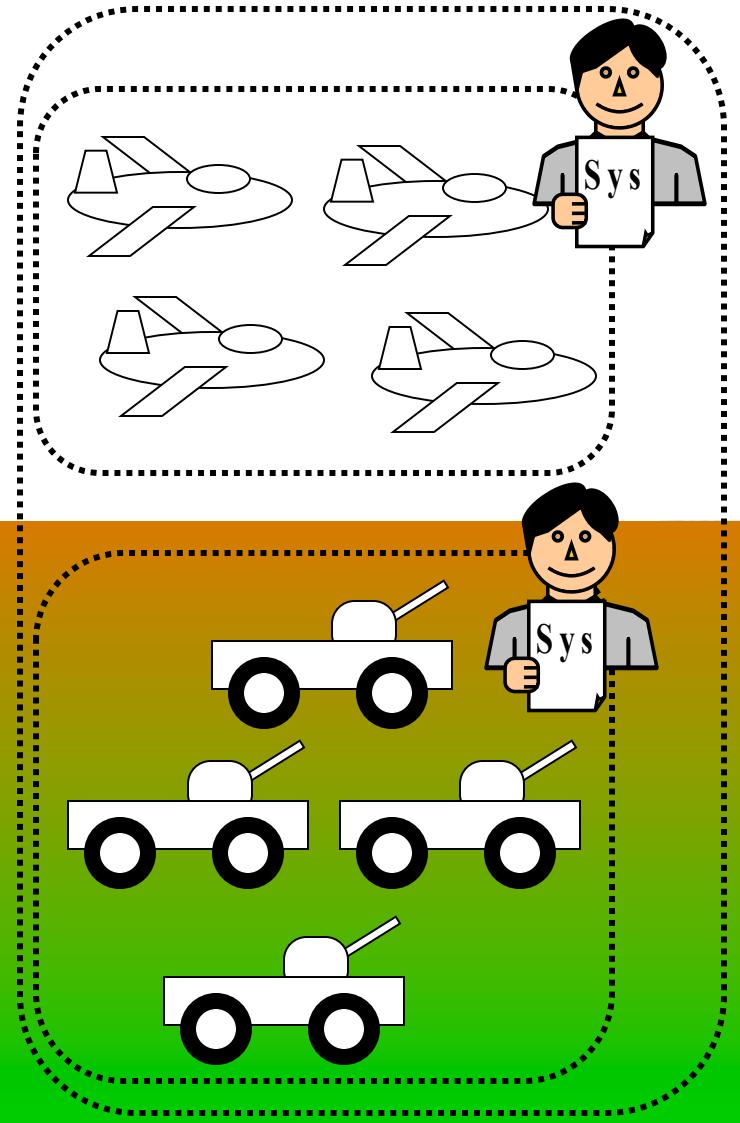

- A story line
- Simplified fictitious case

Platform-Centric Capabilities & Development

Transition to an Integrated Capability

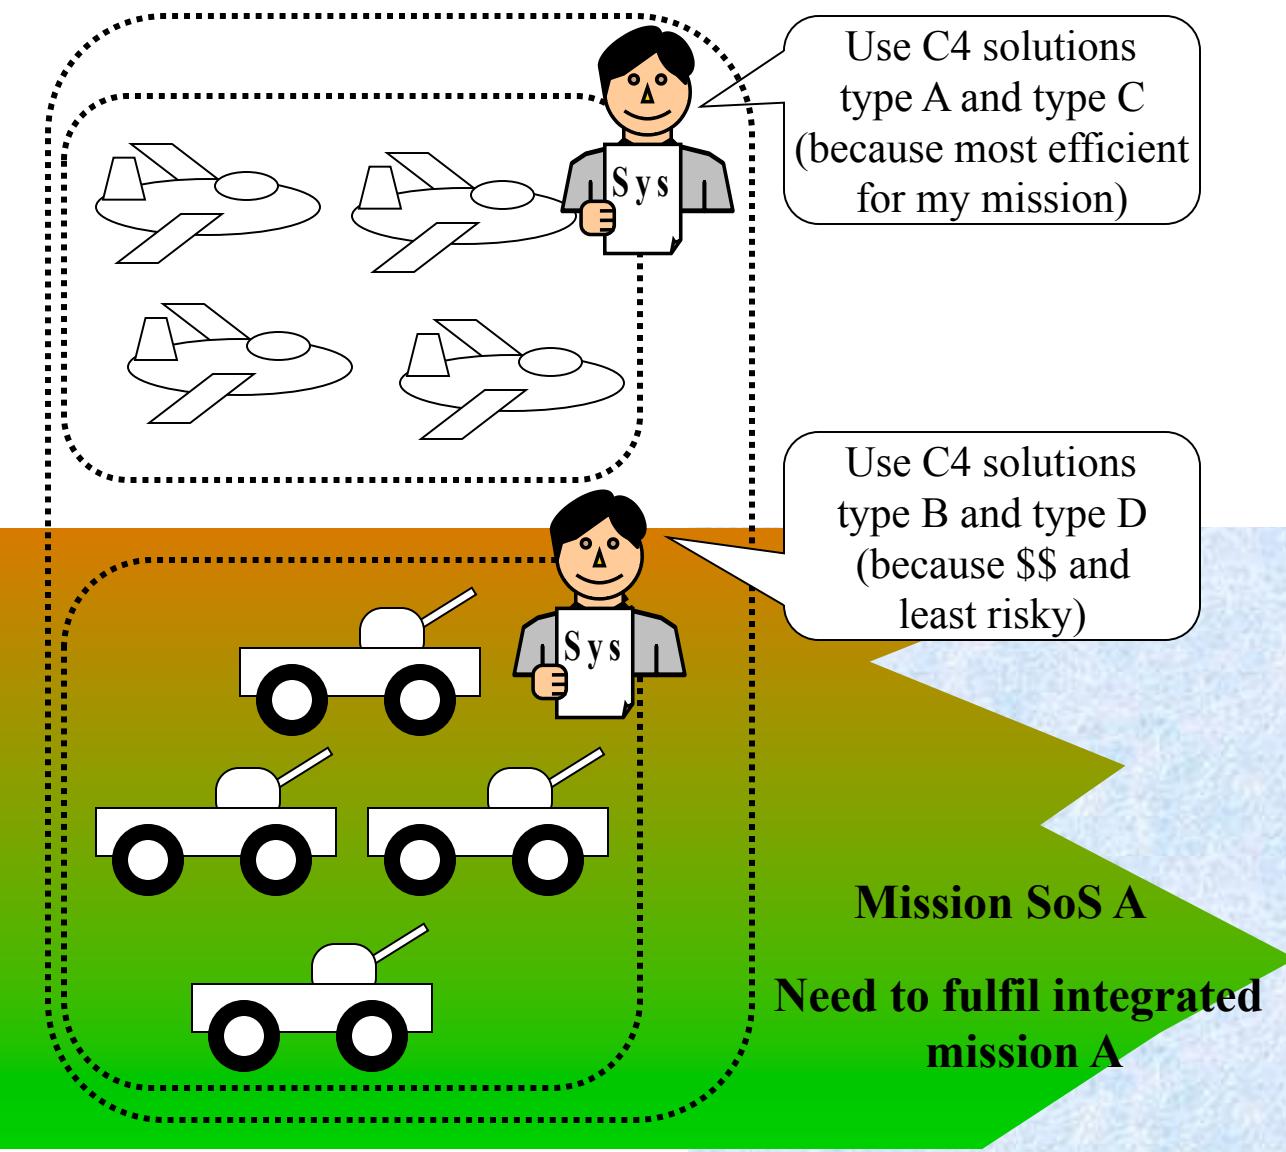

Transition to an Integrated Capability

Mission SoS A

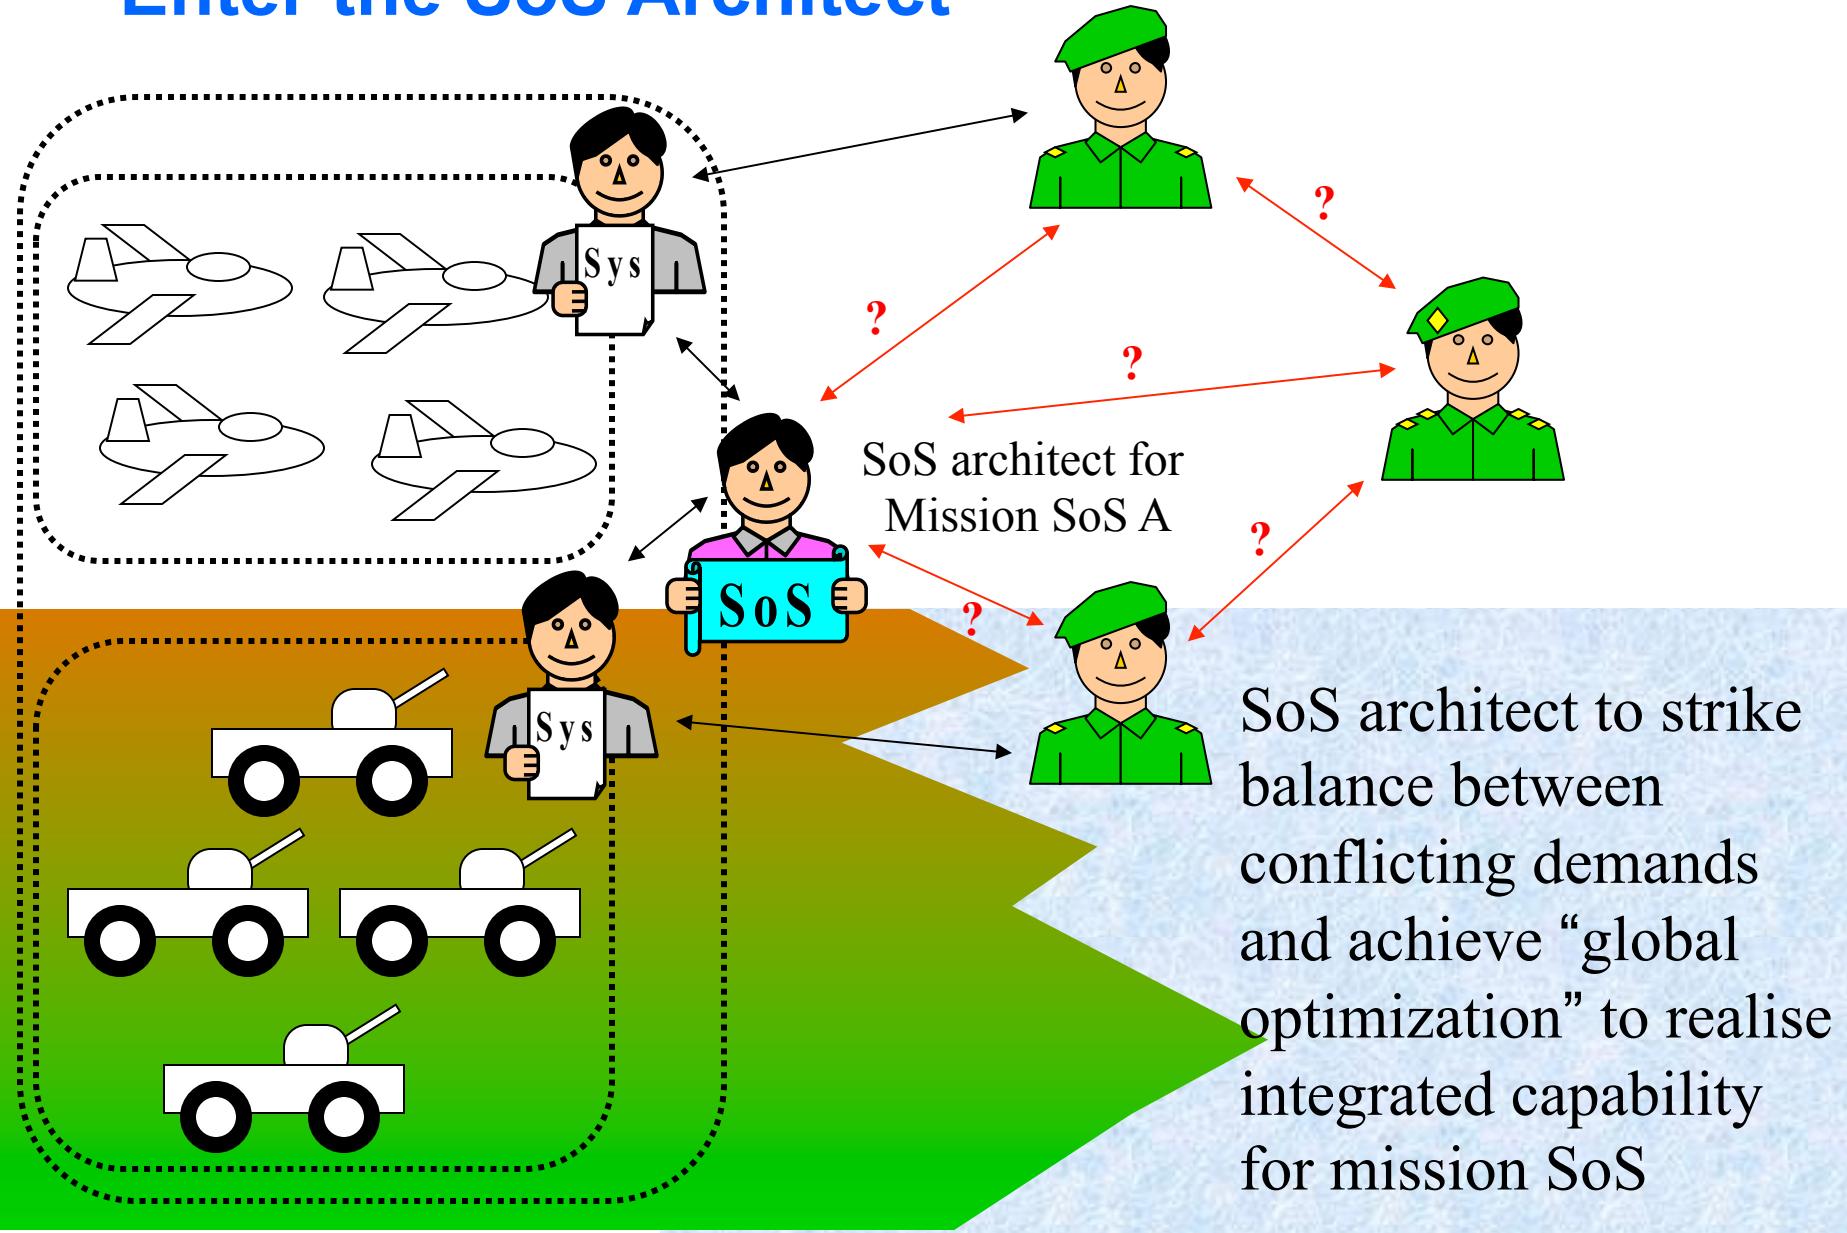

Needs to fulfil
integrated mission A

Need to Enhance Technical Organization Structure for the Development of an SoS

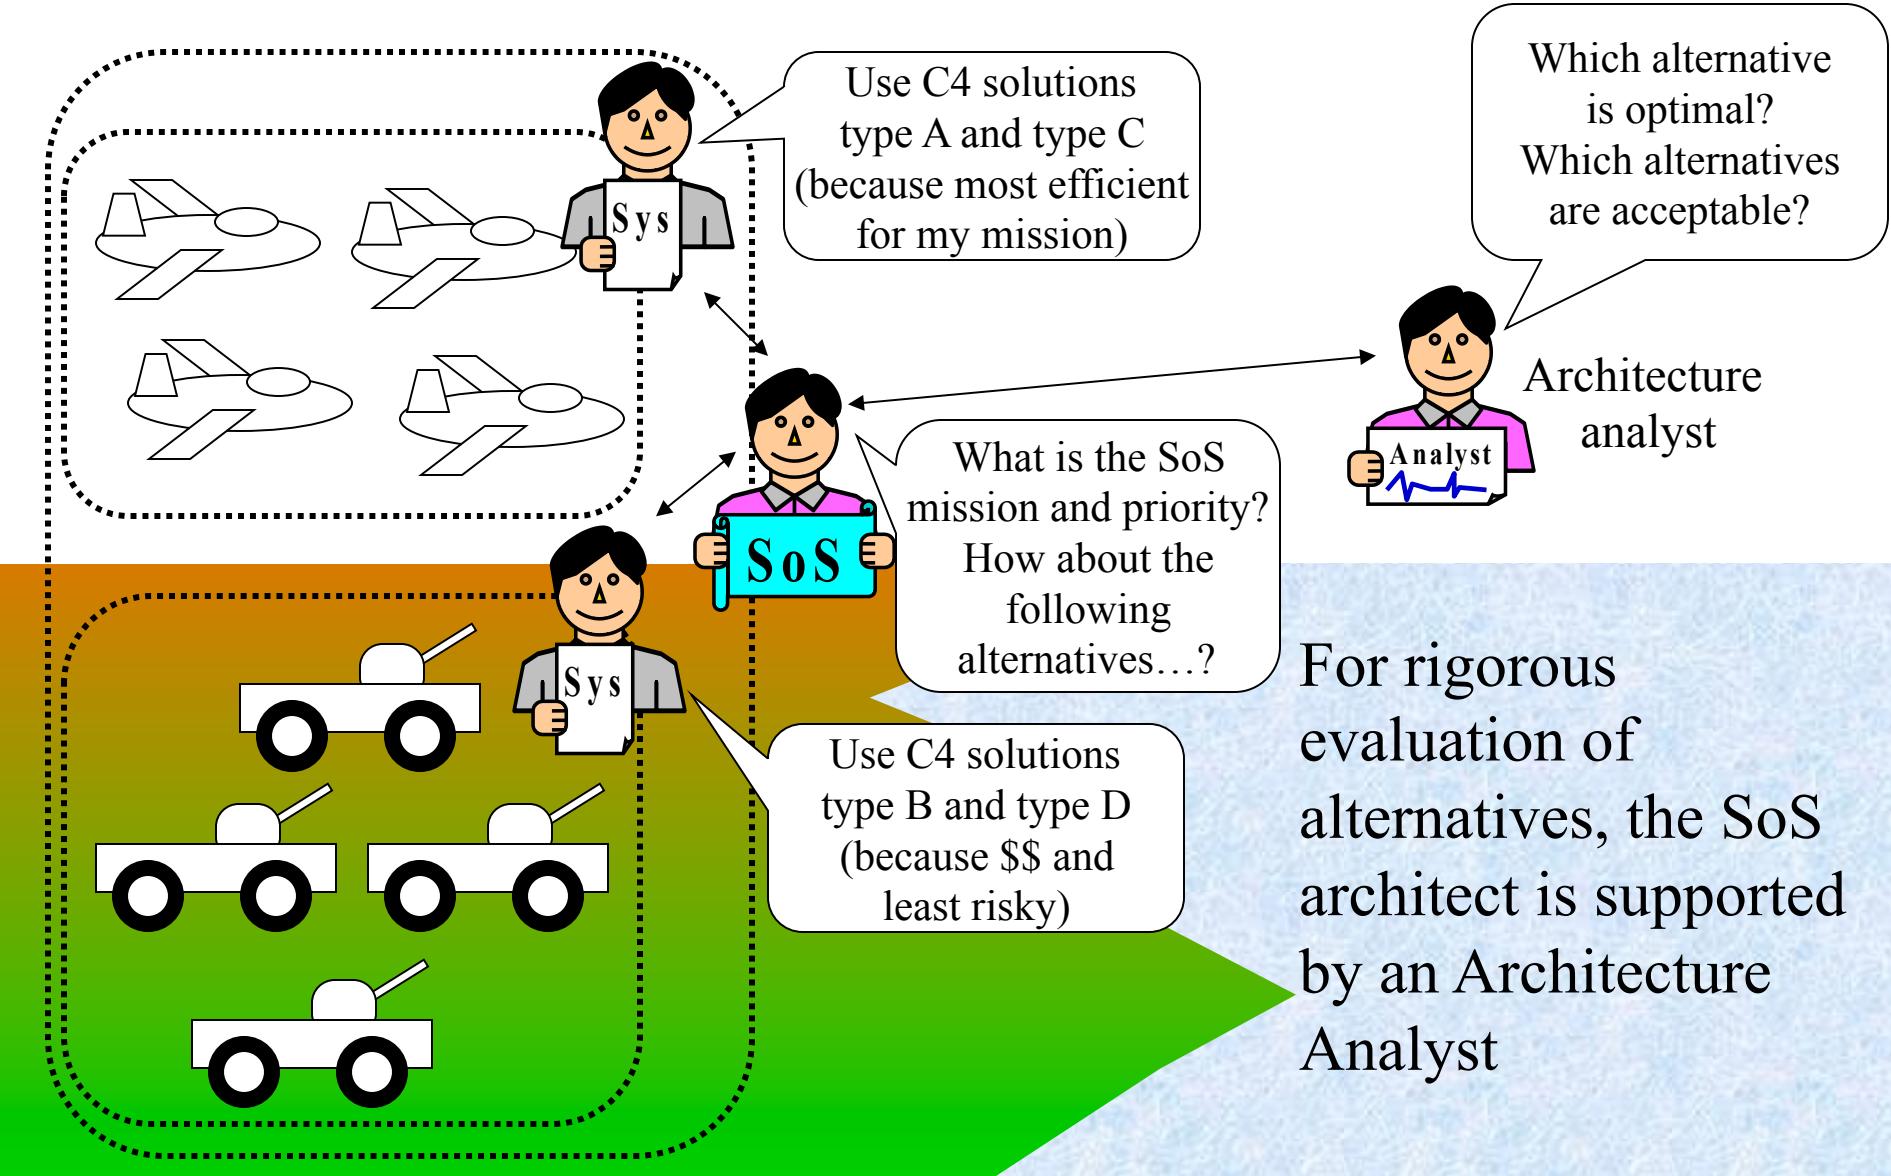

Example: To achieve C4 interoperability to fulfil integrated mission A, issues of “local optimization” may need to be addressed

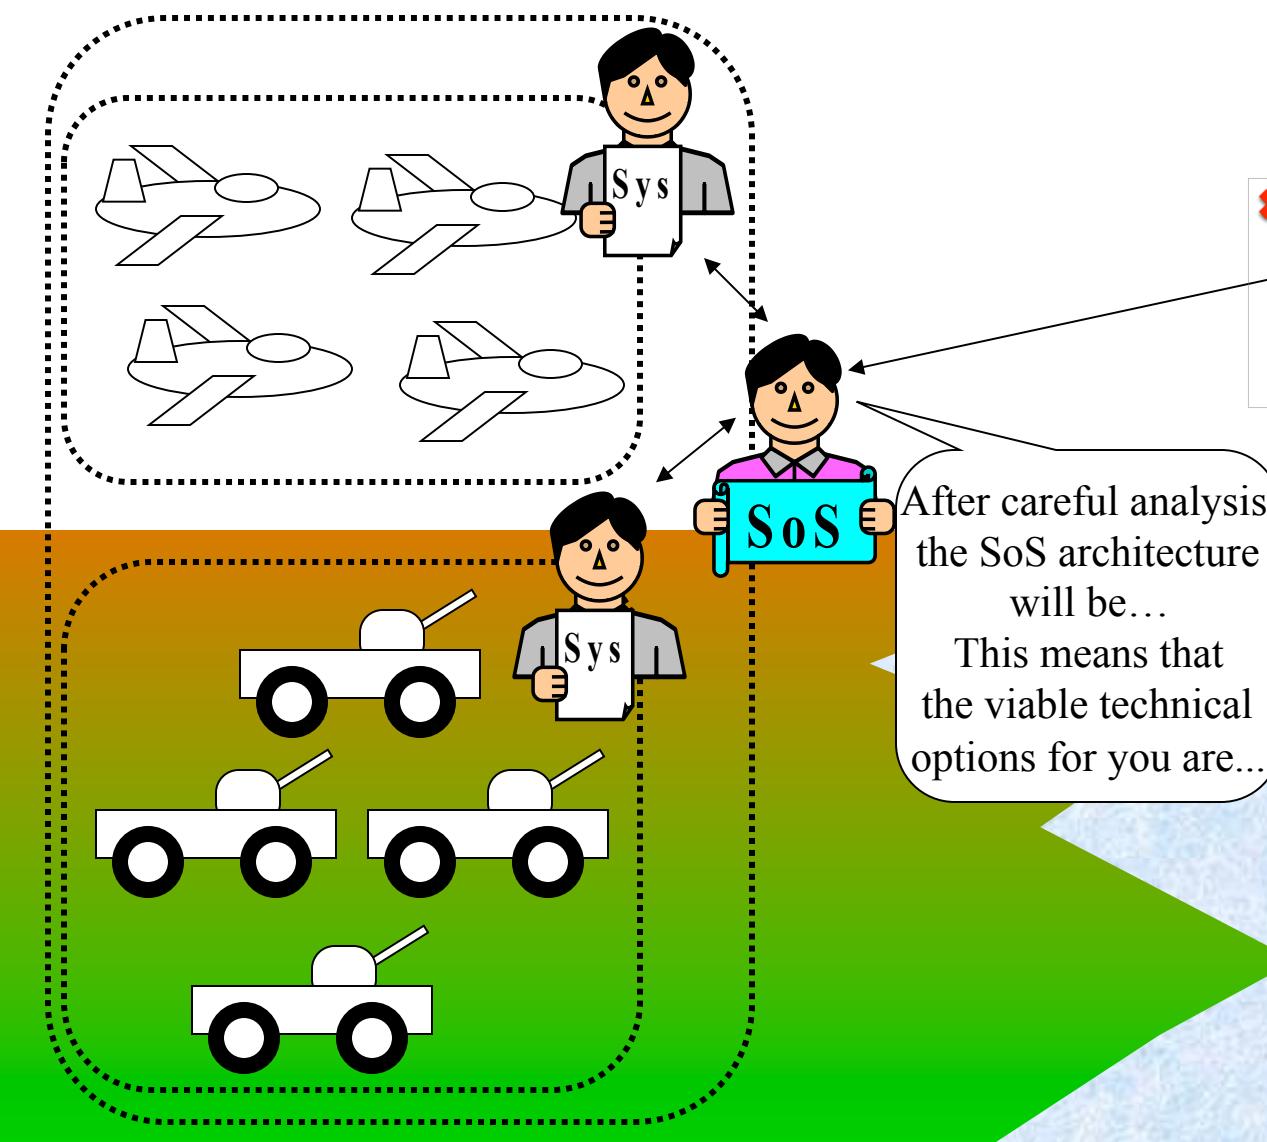

Enter the SoS Architect

Enter the Architecture Analyst

The SoS Architect Finalizes the SoS Architecture

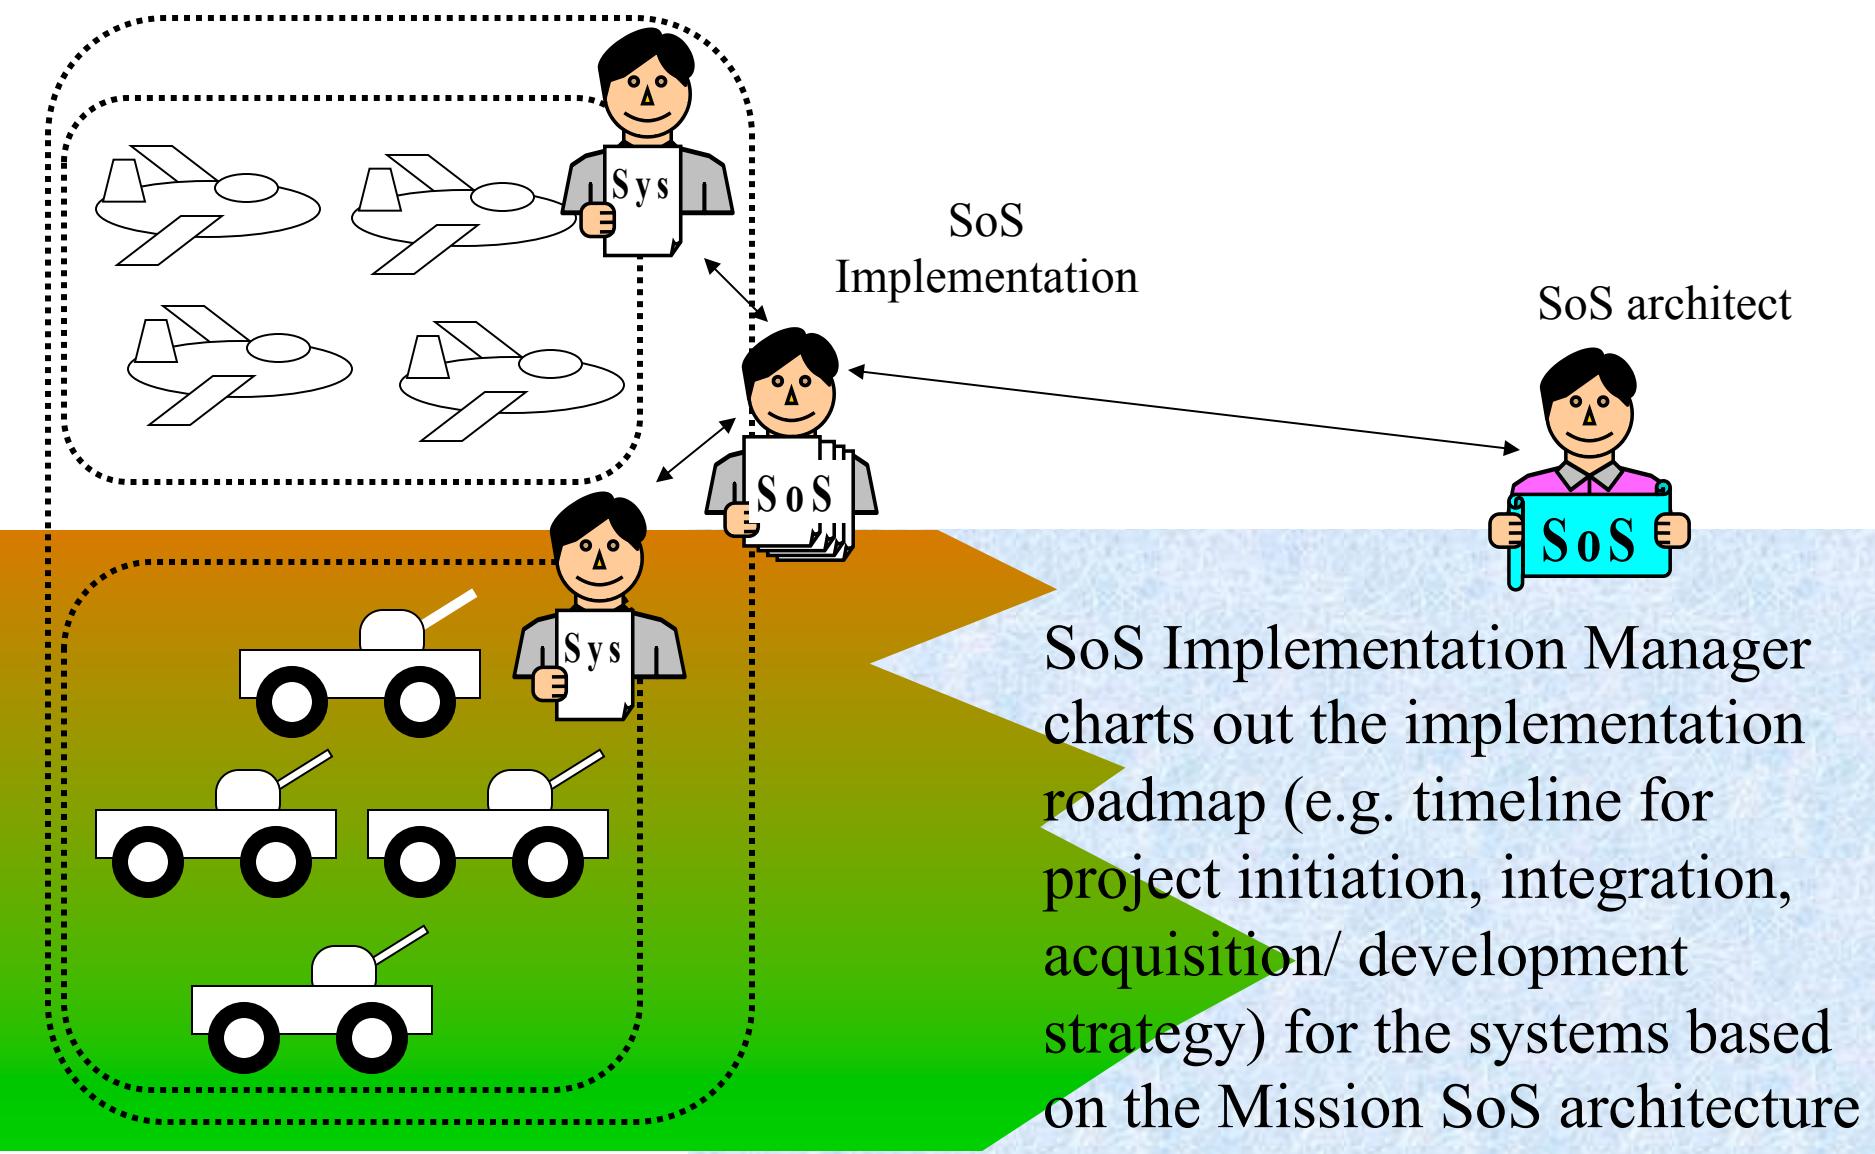

In terms of

- mission performance
- intrinsic resilience of architecture (flexibility, robustness...)

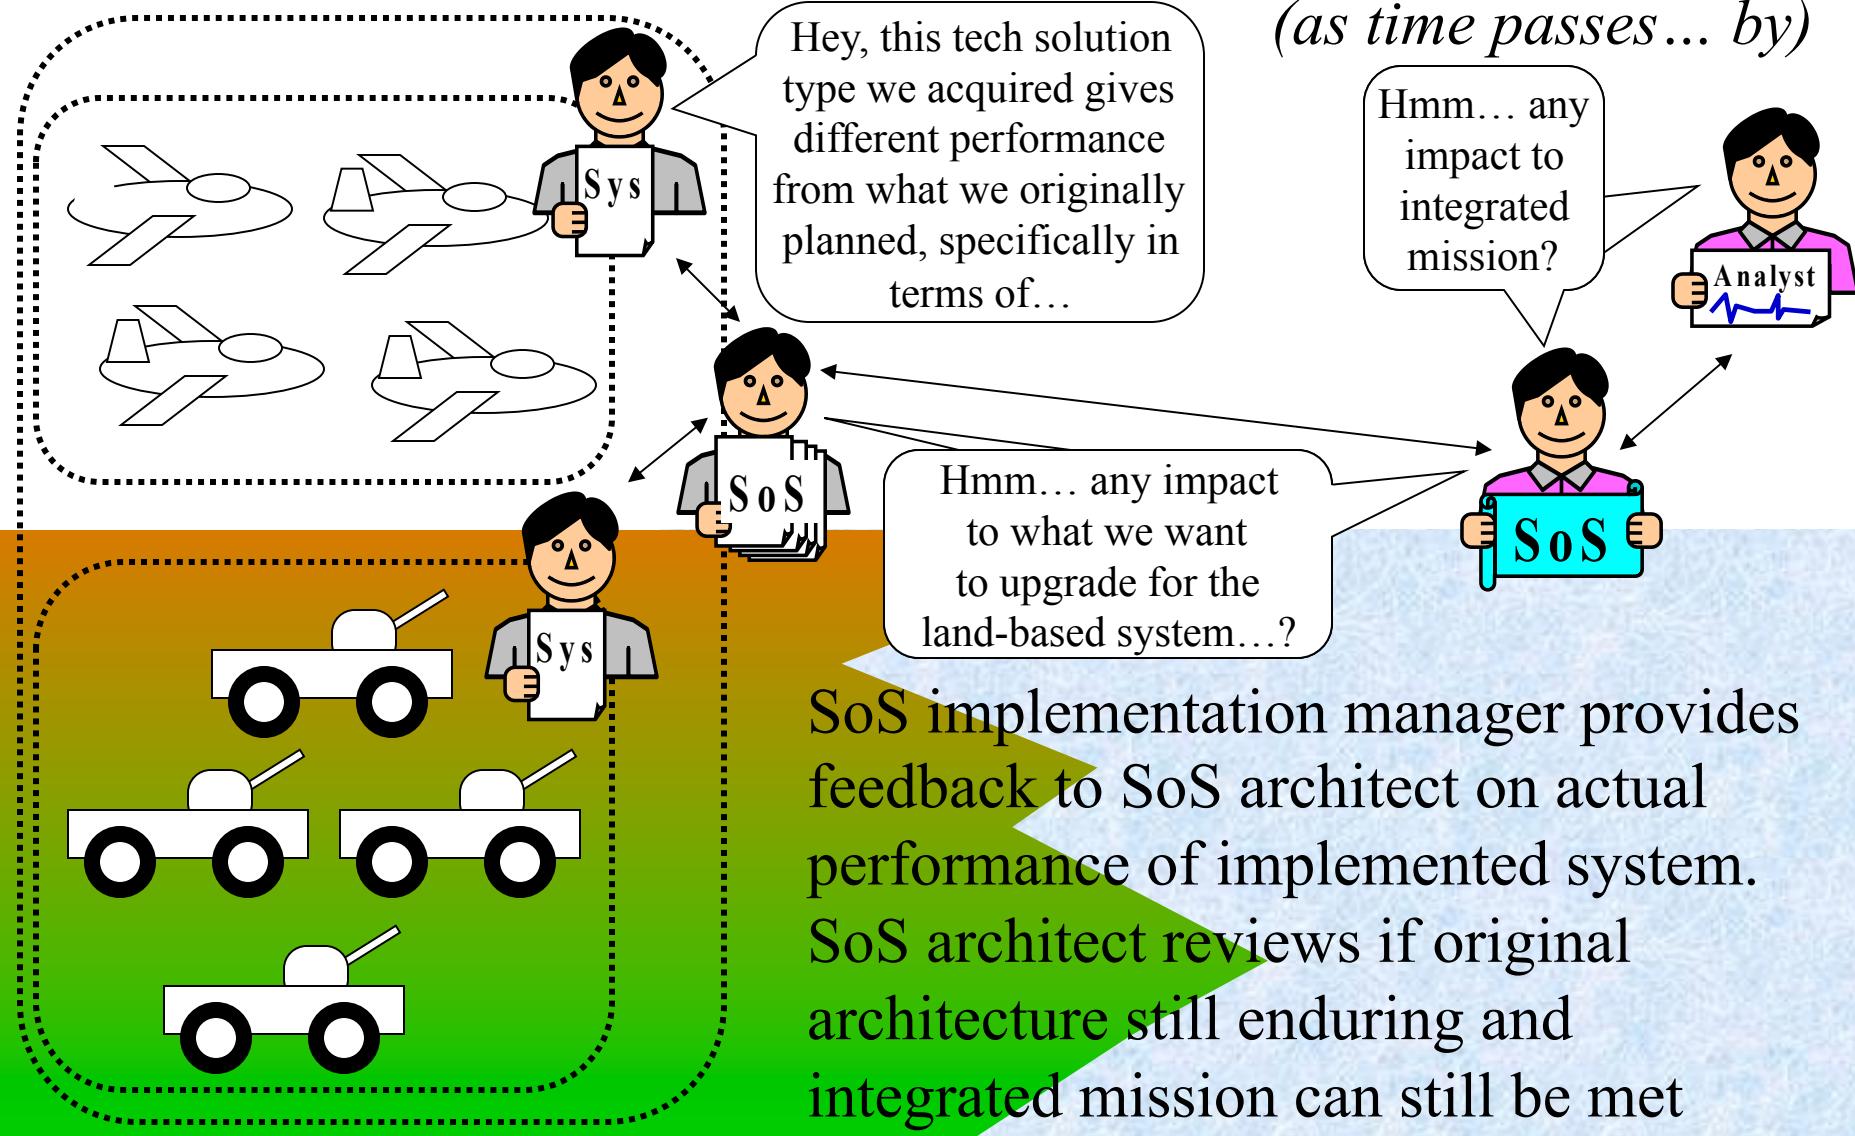

the comparison of the alternatives is as follow...

SoS architect reviews the analysis findings and finalizes the mission SoS architecture

Enter the SoS Implementation Manager

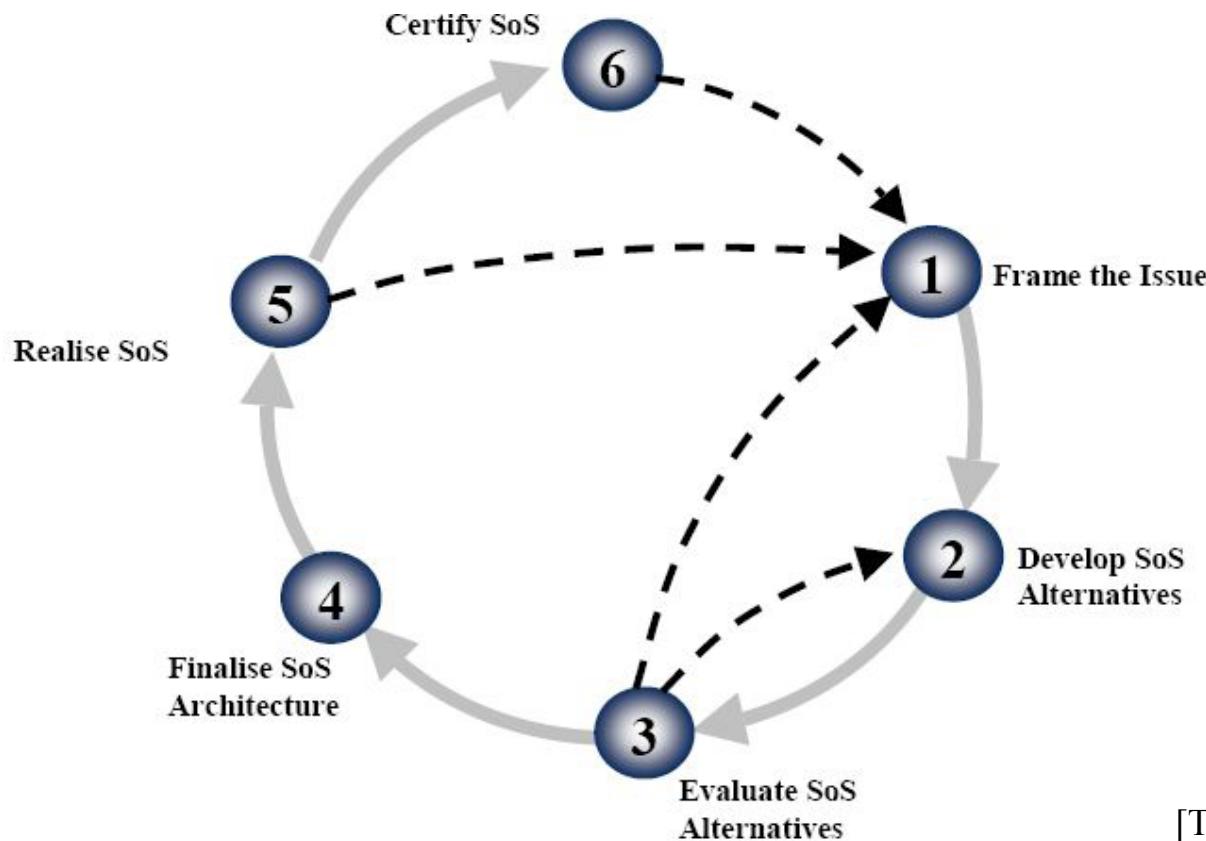

Feedback from the SoS Implementation

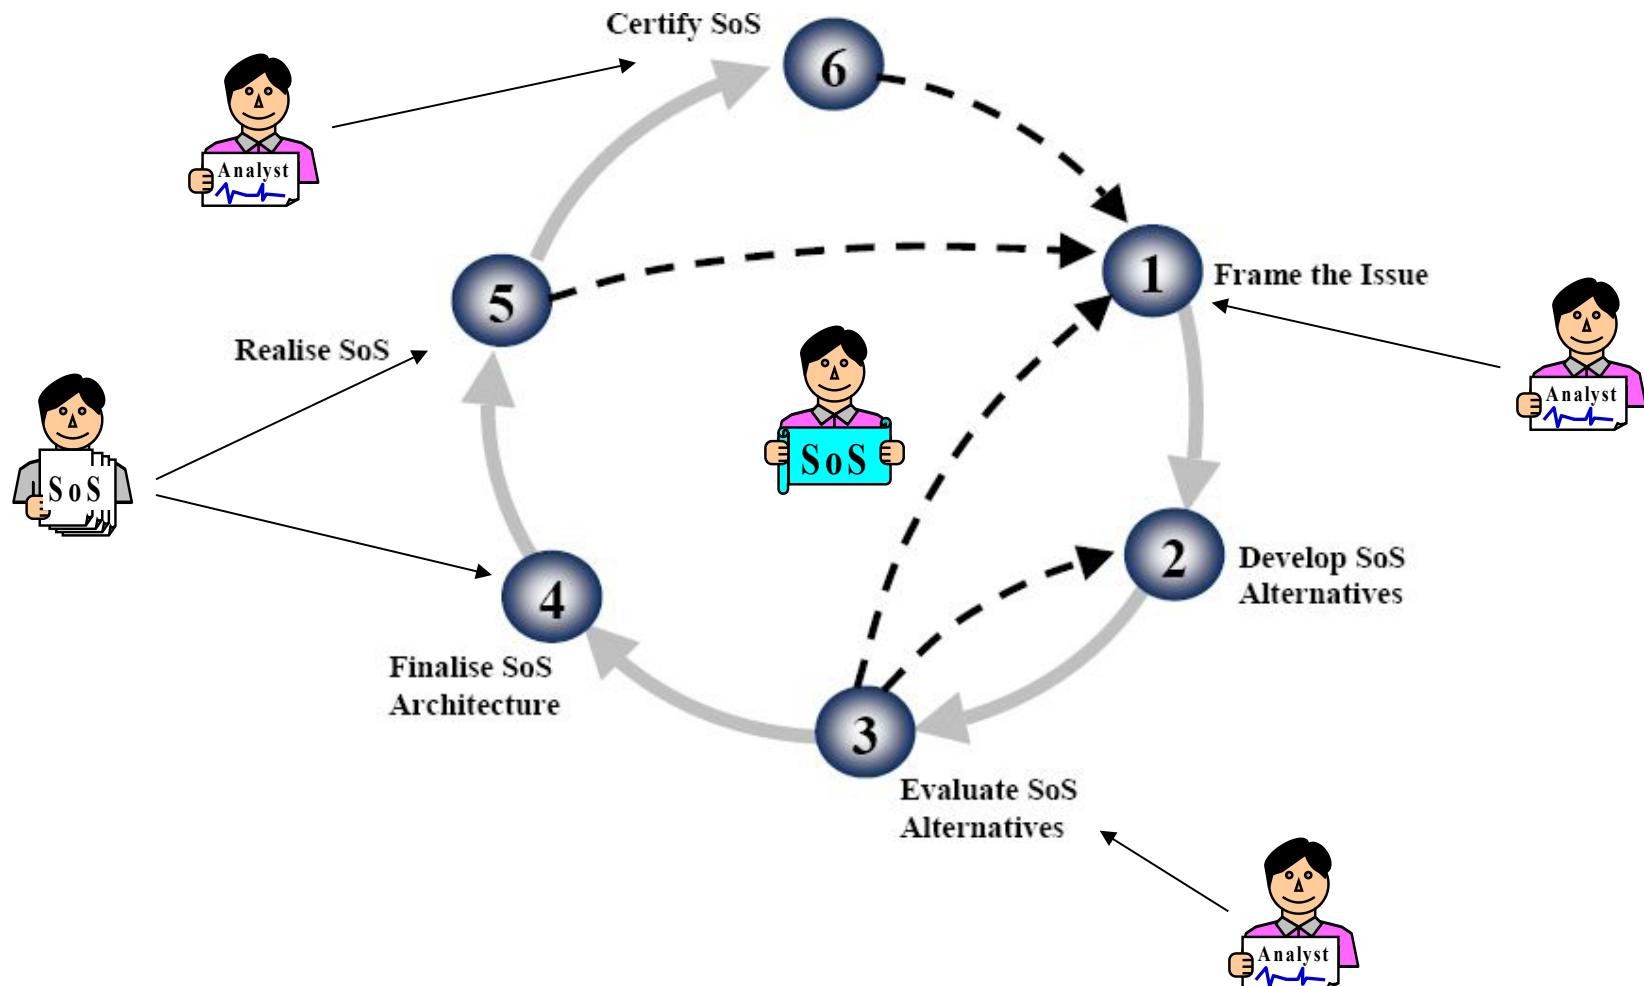

Architecting Process for SoS Architect to Develop Integrated Capabilities

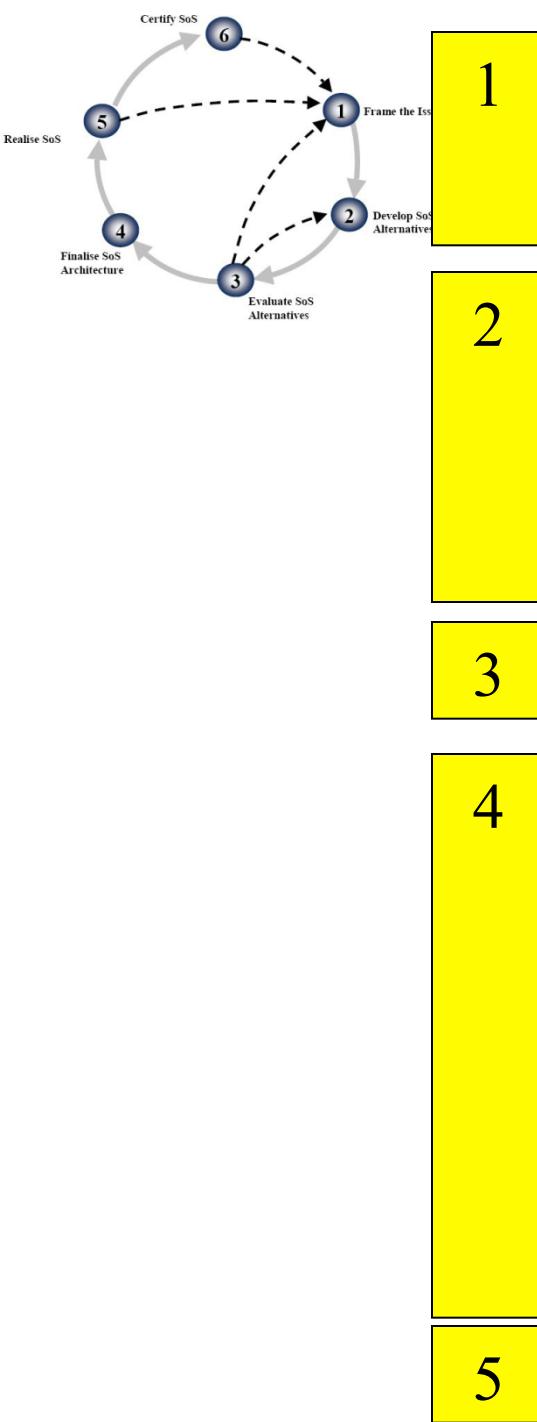

- we briefly illustrated phases 1 to 5 in our story

[Tan et al 09]

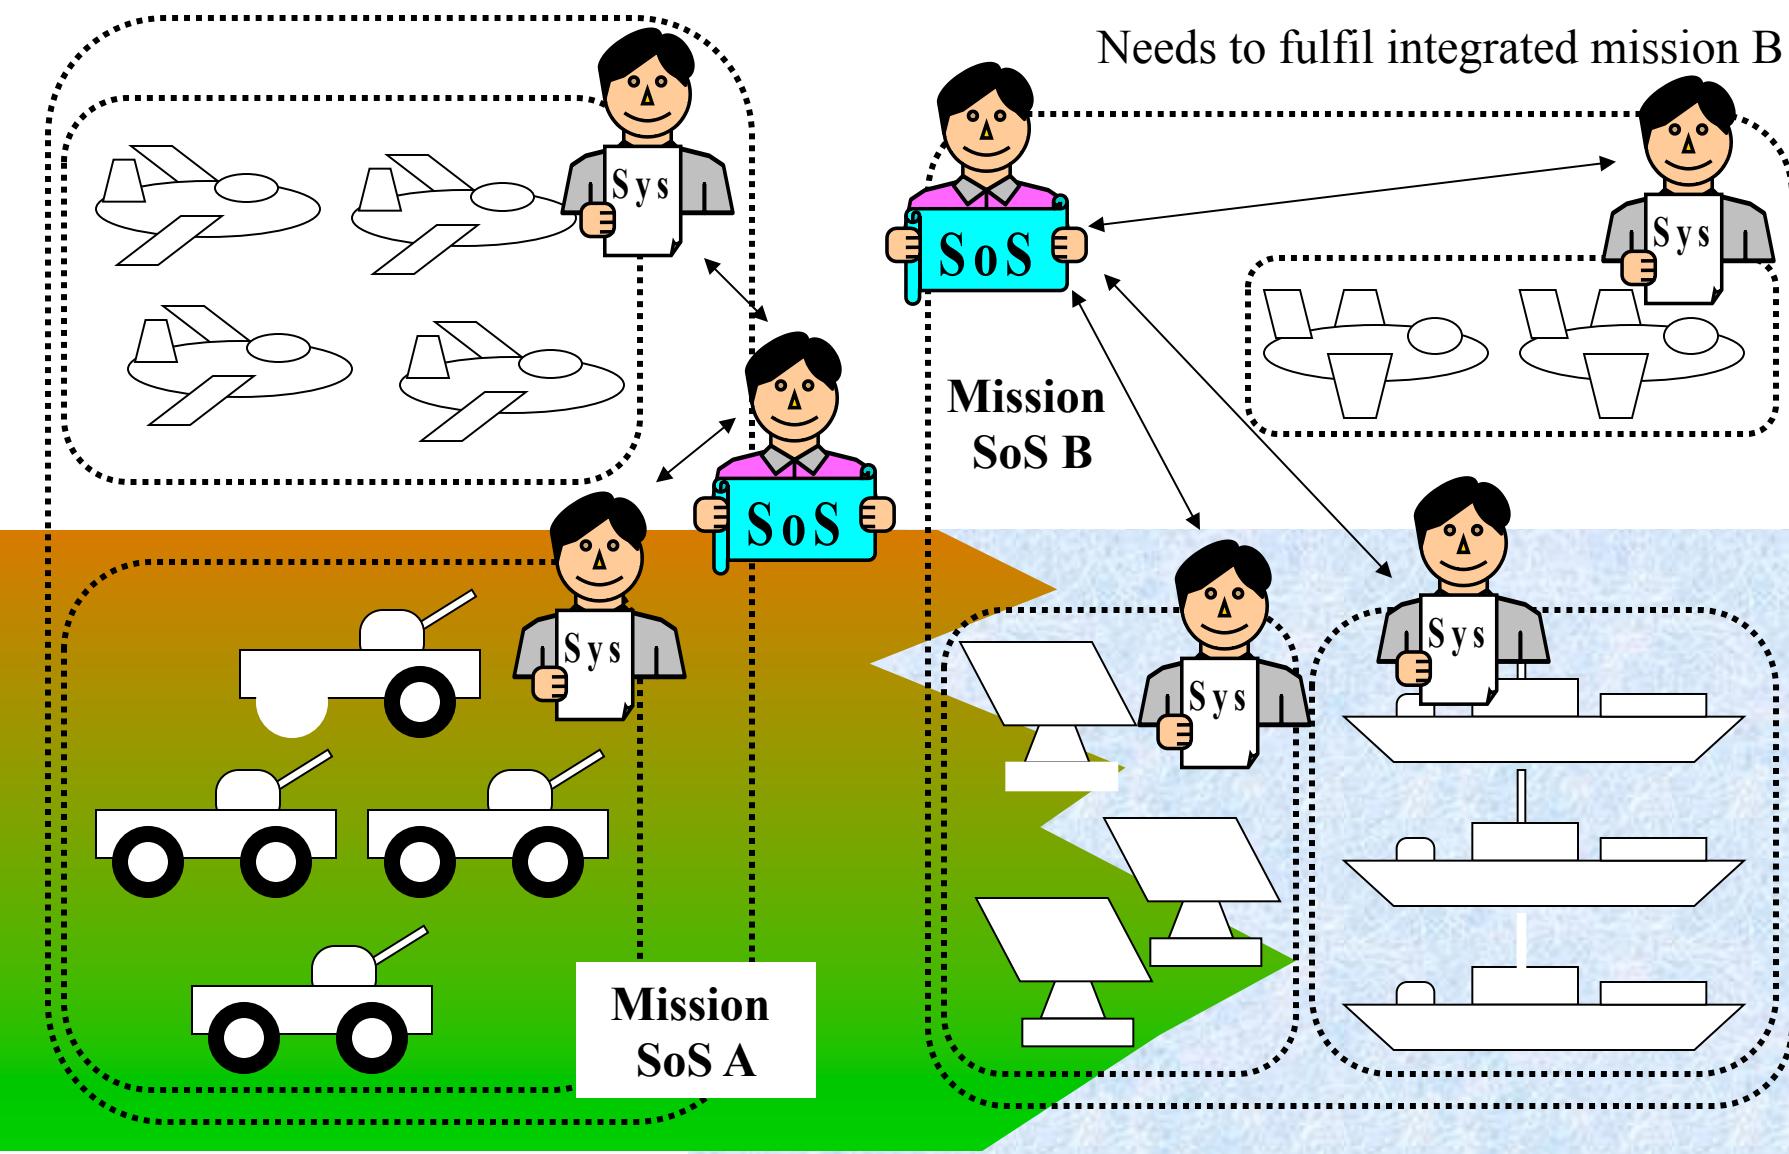

Interactions between SoS Architect, Architecture Analyst and SoS Implementation Manager

Activities to architect an SoS	Technical lead for SoS A
Establish the operational environment, threats and mission objective for this SoS	Not applicable (military stakeholders only)
Establish the existing capability gap of this SoS	SoS Architect (SoS A),
	supported by Architecture Analyst
Develop SoS alternatives (across required time frames) via redefining	Overall – SoS Architect (SoS A)
SoS boundaries (and roles of platforms)	SoS Architect (SoS A)
Connectivity requirements for platforms	SoS Architect (SoS A)
Evaluate SoS alternatives	Architecture Analyst,
	SoS Architect (SoS A)
Finalize SoS architecture based on acceptable SoS alternatives	Overall – SoS Architect (SoS A),
Establish SoS implementation road map based on	Overall – SoS Implementation Manager (SoS A)
SoS architecture and SoS capability spirals	SoS Architect (SoS A)
Acquisition or development strategy for constituent systems	SoS Implementation Manager (SoS A) and
Decision points for constituent systems (e.g. project initiation date, integration date)	SoS Implementation Manager (SoS A)

But Mission SoS A does not exist in isolation...

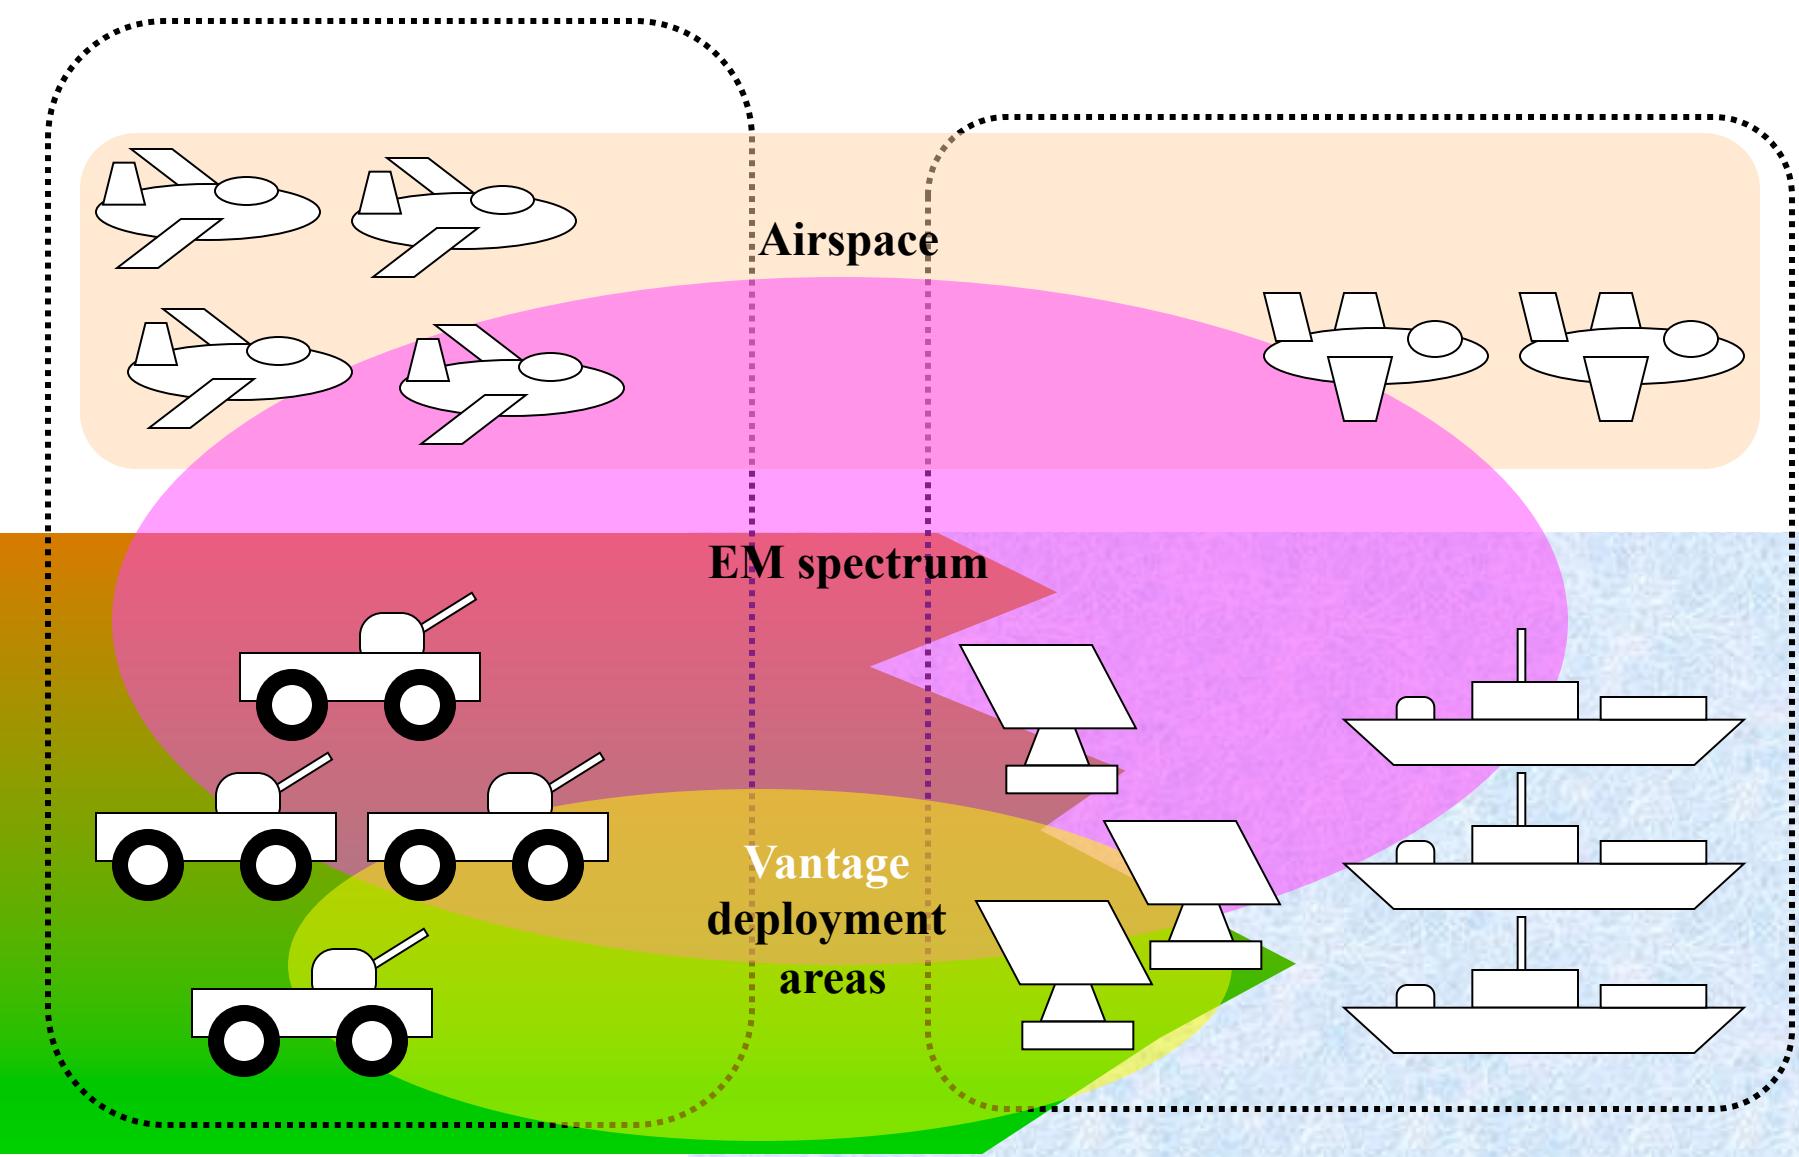

But Mission SoS A does not exist in isolation...

- It takes various SoS and systems fulfil a broad range of missions for defence and national security
 - SoS A, SoS B, SoS C....
 - “Isolated” systems M, N, ...
- What are some potential challenges for each Mission SoS to fulfil its integrated mission?

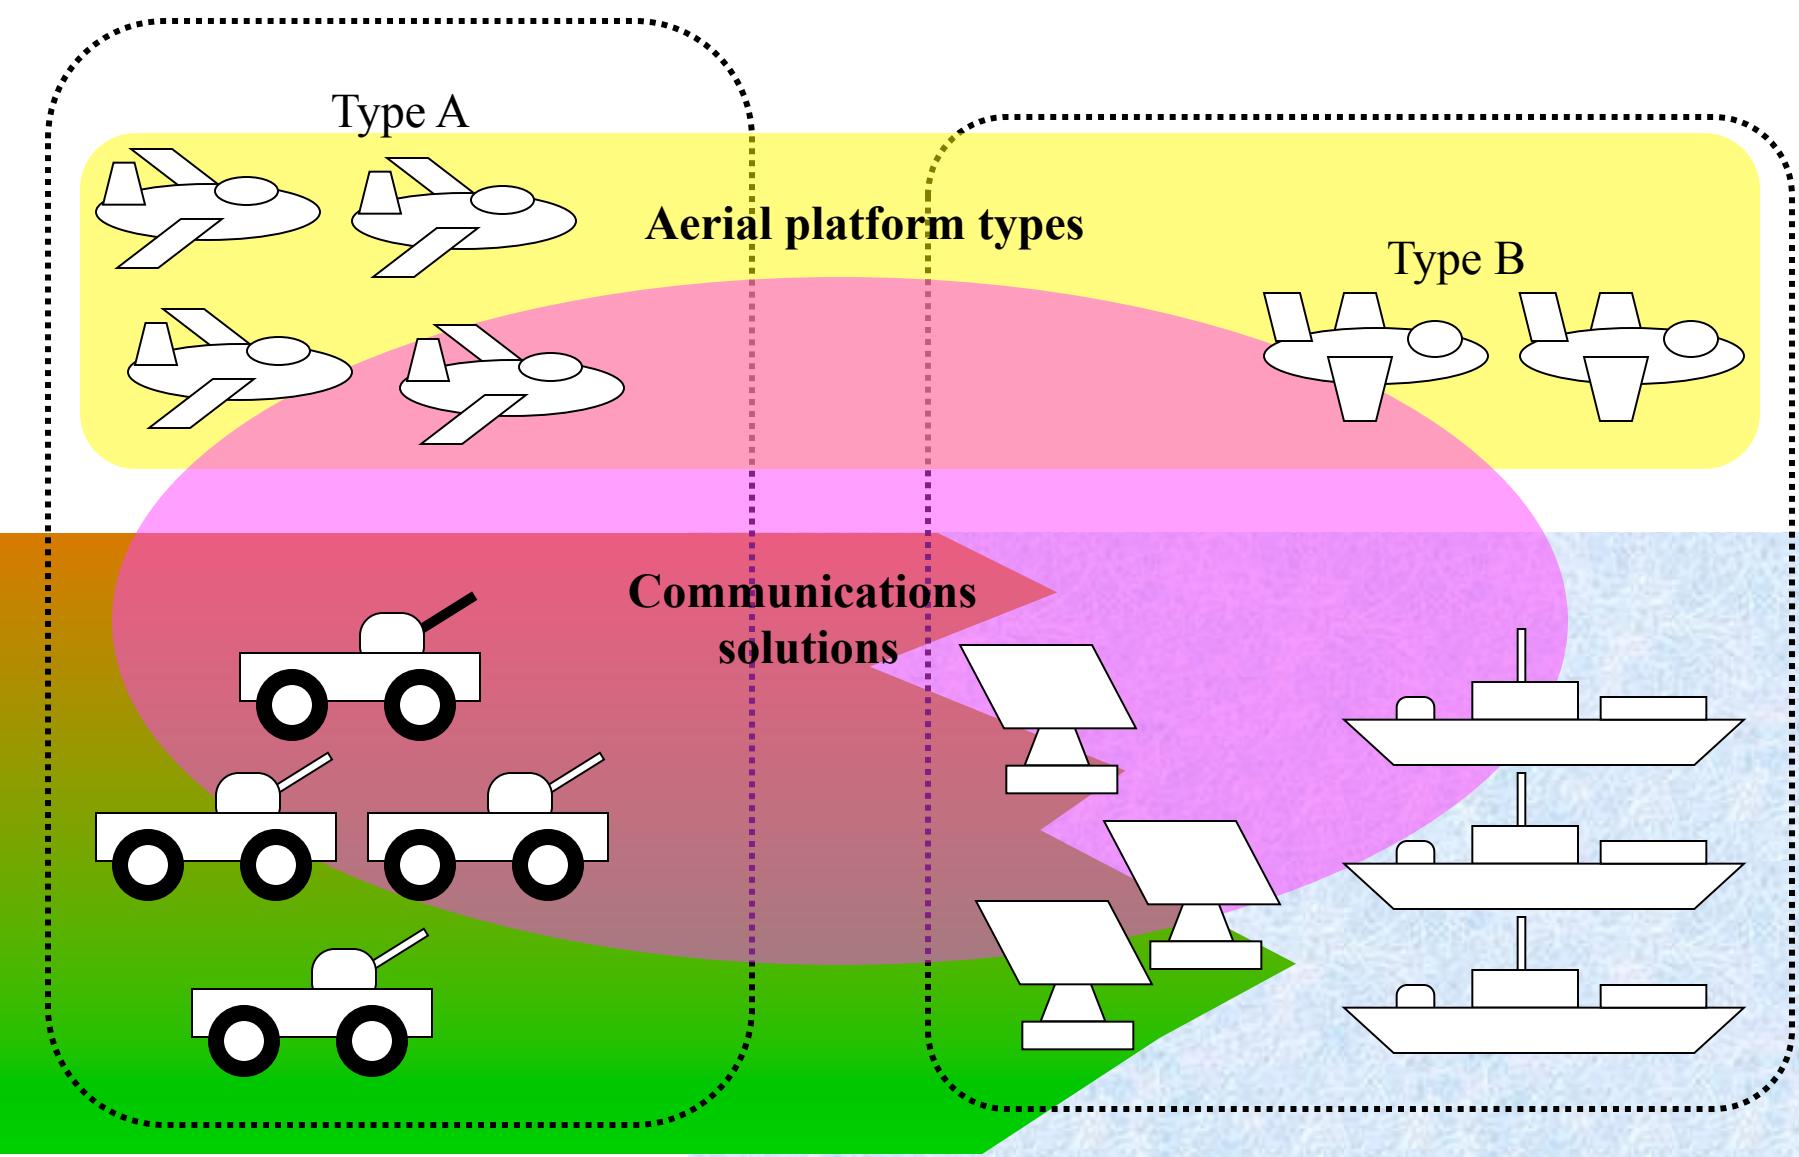

Potential Challenges

- Competition for **Enterprise Resources**
 - finite, non-scalable resources shared across various Mission SoS
 - e.g. EM spectrum (if emphasis is on networked capabilities)
 - e.g. vantage deployment sites, airspace etc
 - will all Mission SoS be able to share these resources and meet their respective integrated mission requirements?
- An non-optimal myriad of **Enterprise Technology**
 - scalable technological solutions used across various Mission SoS
 - e.g. C4 solutions (if emphasis is on networked capabilities)
 - e.g. aerial platform types
 - can certain technology requirements be streamlined at the enterprise level (across various Mission SoS) so that sustainable (e.g. human resource, cost) capabilities can be achieved?

Competition for Enterprise Resources

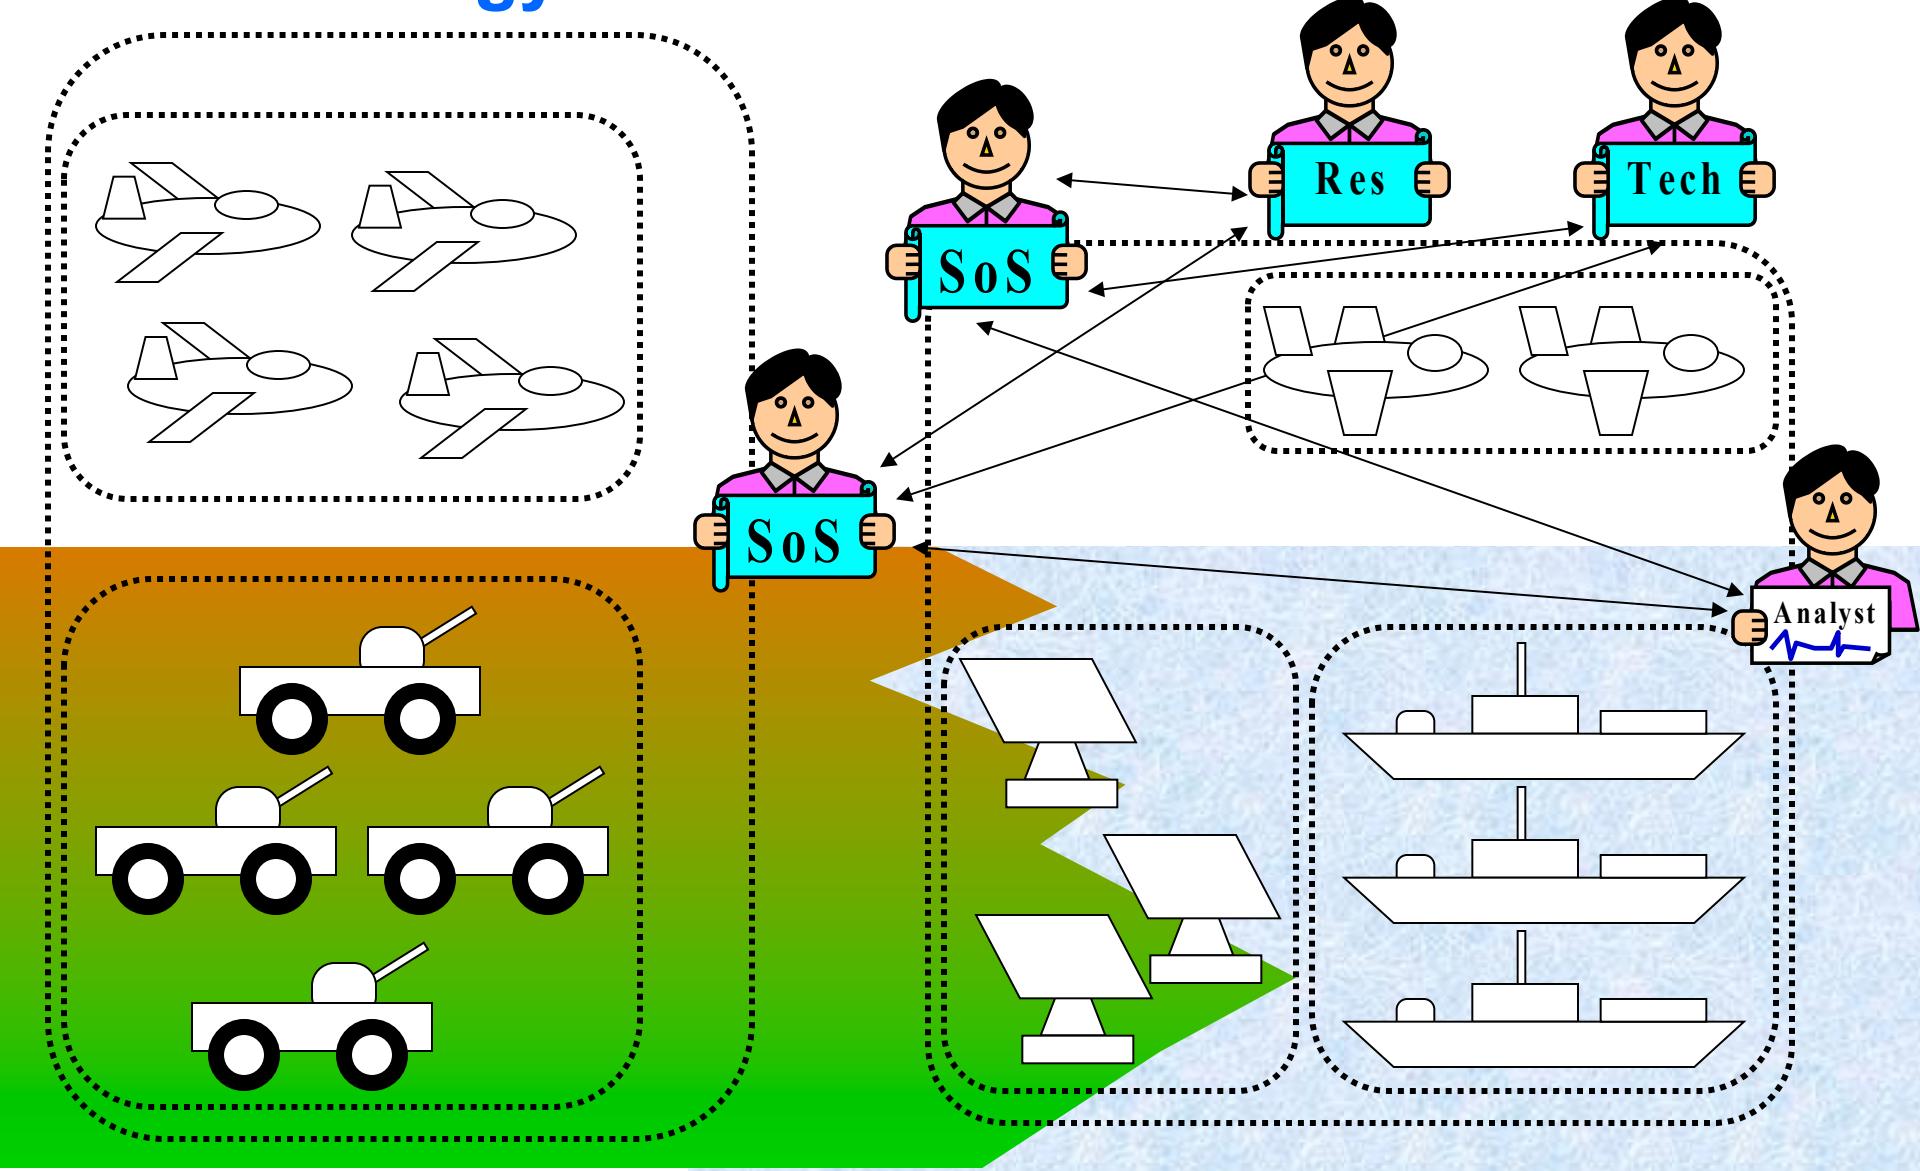

A Myriad of Systems & Technical Solutions

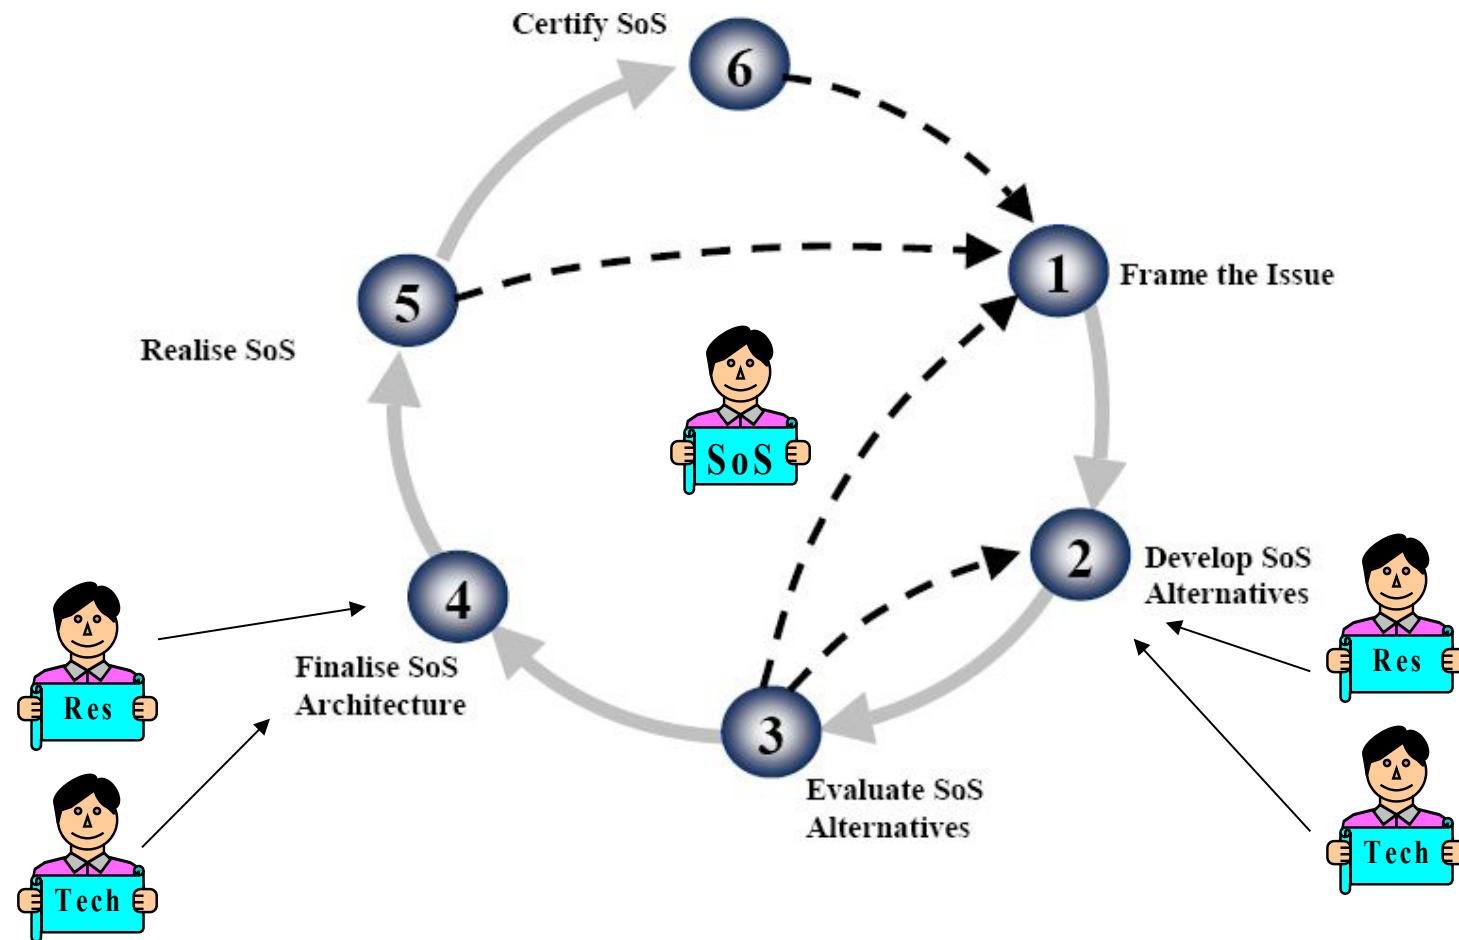

Enter the Resource Architect & Technology Architect

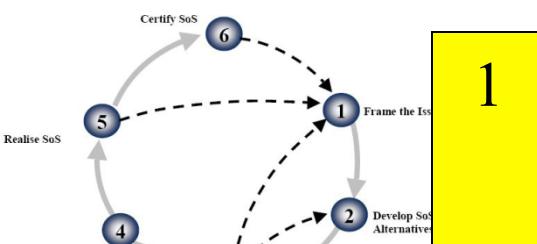

Resource architect

Technology architect

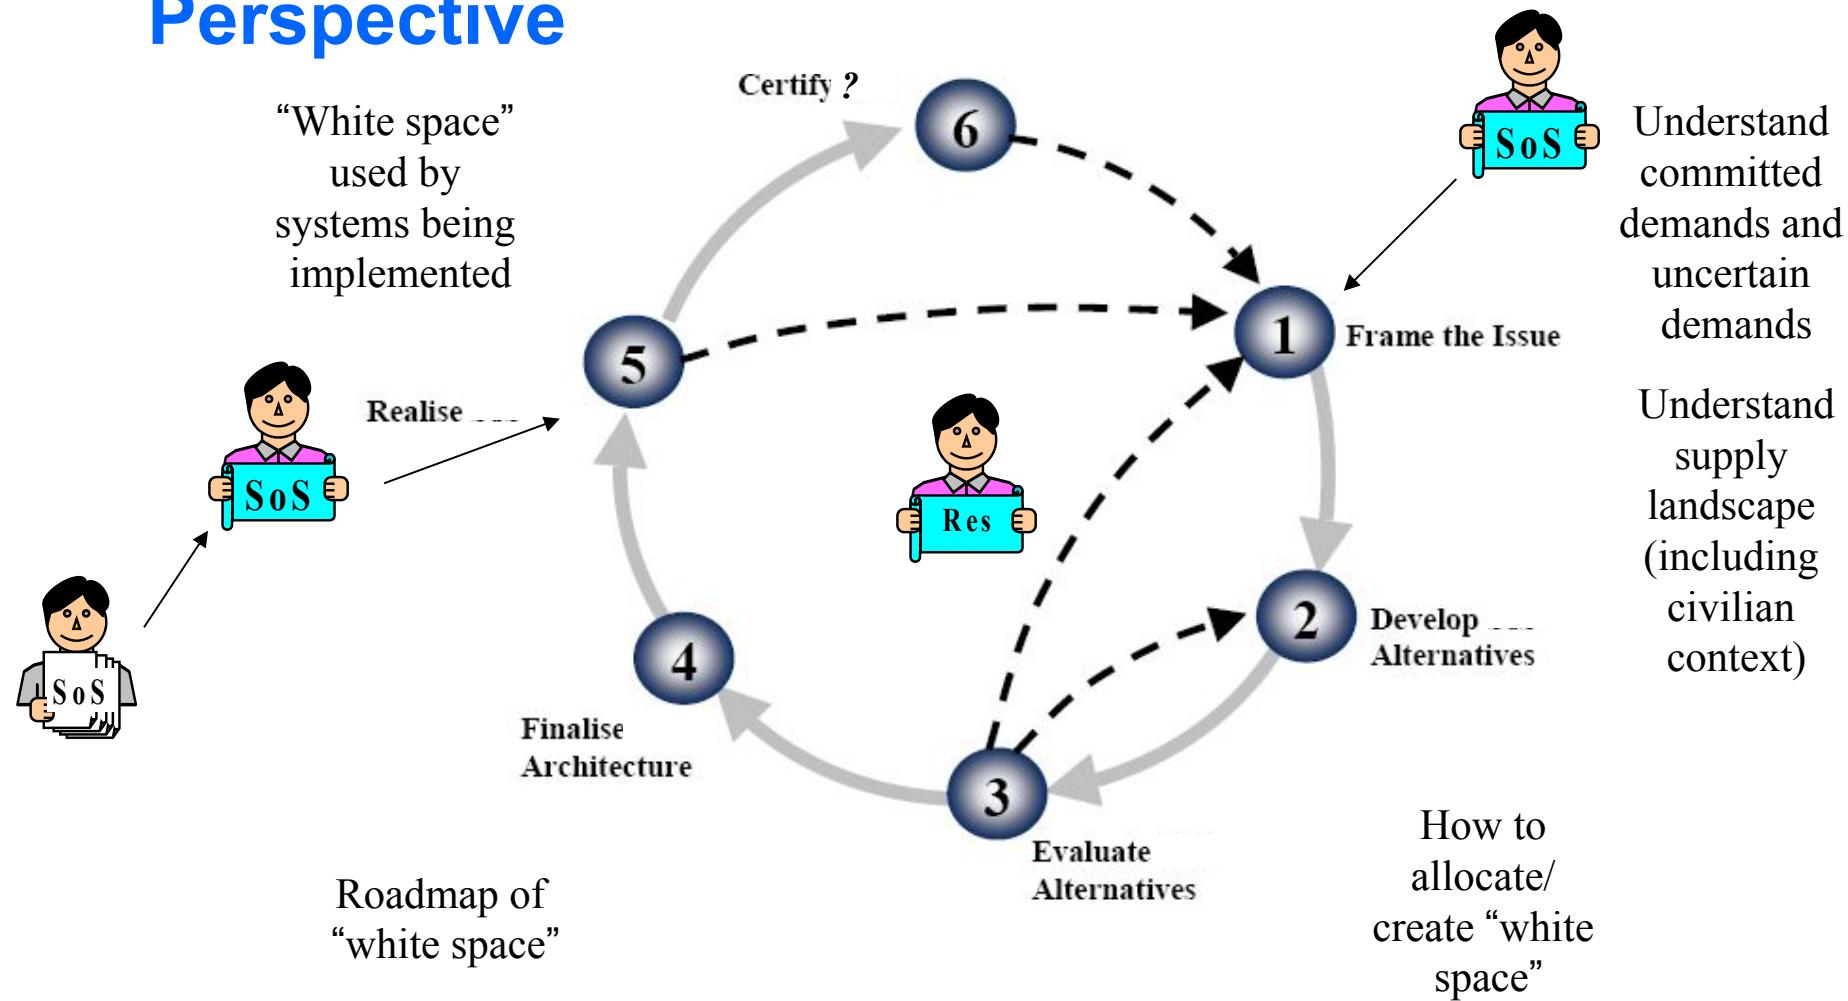

Interactions between Architects in the Process (SoS Architect's Perspective)

 <p>The diagram illustrates a cyclical process for SoS architecture. It starts with 'Frame the Issue' (1), followed by 'Develop SoS Alternatives' (2), 'Evaluate SoS Alternatives' (3), 'Finalise SoS Architecture' (4), 'Realise SoS' (5), and ends with 'Certify SoS' (6). Arrows indicate a clockwise flow between these steps, with dashed lines connecting the first five steps to the final 'Certify SoS' step.</p>	<p>Activities to architect an SoS</p> <table border="1"> <thead> <tr> <th>Activity</th> <th>Technical lead for SoS A</th> <th>Technical lead for SoS B</th> </tr> </thead> <tbody> <tr> <td>Establish the operational environment, threats and mission objective for this SoS</td> <td>Not applicable (military stakeholders only)</td> <td>Not applicable (military stakeholders only)</td> </tr> <tr> <td>Establish the existing capability gap of this SoS</td> <td>SoS Architect (SoS A), supported by Architecture Analyst</td> <td>SoS Architect (SoS B),</td> </tr> <tr> <td>Develop SoS alternatives (across required time frames) via redefining</td> <td>Overall – SoS Architect (SoS A)</td> <td>Overall – SoS Architect (SoS B)</td> </tr> <tr> <td>SoS boundaries (and roles of platforms)</td> <td>SoS Architect (SoS A)</td> <td>SoS Architect (SoS B)</td> </tr> <tr> <td>Connectivity requirements for platforms</td> <td>SoS Architect (SoS A)</td> <td>SoS Architect (SoS B)</td> </tr> <tr> <td>Application of specific Enterprise Technology</td> <td colspan="2">Various Technology Architects</td></tr> <tr> <td>Utilization of specific Enterprise Resources</td> <td colspan="2">Various Resource Architects</td></tr> </tbody> </table>	Activity	Technical lead for SoS A	Technical lead for SoS B	Establish the operational environment, threats and mission objective for this SoS	Not applicable (military stakeholders only)	Not applicable (military stakeholders only)	Establish the existing capability gap of this SoS	SoS Architect (SoS A), supported by Architecture Analyst	SoS Architect (SoS B),	Develop SoS alternatives (across required time frames) via redefining	Overall – SoS Architect (SoS A)	Overall – SoS Architect (SoS B)	SoS boundaries (and roles of platforms)	SoS Architect (SoS A)	SoS Architect (SoS B)	Connectivity requirements for platforms	SoS Architect (SoS A)	SoS Architect (SoS B)	Application of specific Enterprise Technology	Various Technology Architects		Utilization of specific Enterprise Resources	Various Resource Architects

Process from the Resource Architect's Perspective

Process from the Technology Architect's Perspective

Interactions between Architects in the Process (Macro Perspective)

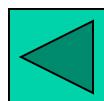

Summary

- Impetus to attain “global optimum” for Mission SoS
- Organizational structure
 - Assume “top-down” leadership viable to oversee system managers
 - SoS Architect, Resource Architect, Technology Architect, SoS Implementation Manager
 - Architecture Analyst
- Broad process for architecting
- Interaction between architects when architecting Mission SoS, Enterprise Resources and Enterprise Technology

Thank you!

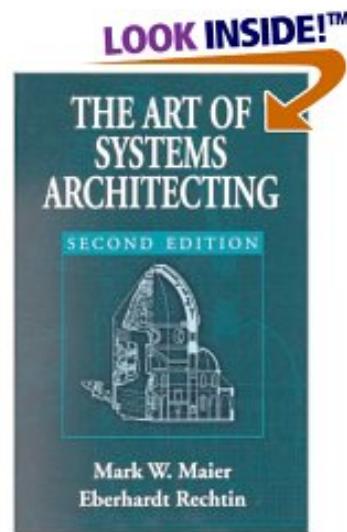

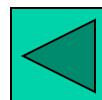

What is Systems Architecting?

- Building the big picture...
- Achieving operational capability greater than sum of what individual systems provide ...
- Satisfying stakeholders ...

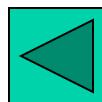

Systems Architecting...

- The Art that complements its science
 - Dealing with immeasurable
 - Reducing past experience and wisdom to practice
 - Involves collaborations with people and organisations
 - Conceptualisation with domain experts using modelling & simulation

Roles of the Systems Architect

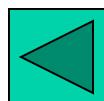

- To lead SoS architecture development
- To strategize the synthesis and integration of capabilities
- To master plan and provide technical governance
- To develop systems architecting tools

Value of Systems Architecting in Defence

- Coherently realise a network-centric SoS capability
- Within an SoS, reduce weaknesses of each system and enhance "jointness" and overall effectiveness
- Creation of positive emergent capabilities

Value of SoS (X_1, \dots, X_n) >> $X_1 + \dots + X_n !!!$

System-of-Systems (SoS)

“System-of-systems” (SoS) are defined as an interoperating collection of component systems that produce results unachievable by the individual systems alone.

INCOSE Systems Engineering Handbook v3

Examples of System-of-Systems

- **Military Context**
 - Maritime Security
 - National Air Defence
- **Civilian Context**
 - Land Transport
 - Civil Aviation

SoS Key Challenges

- Balancing stakeholders' needs and requirements
- Interoperability and integration amidst change
- Complexity challenges
