Risk – a Modern Phenomena

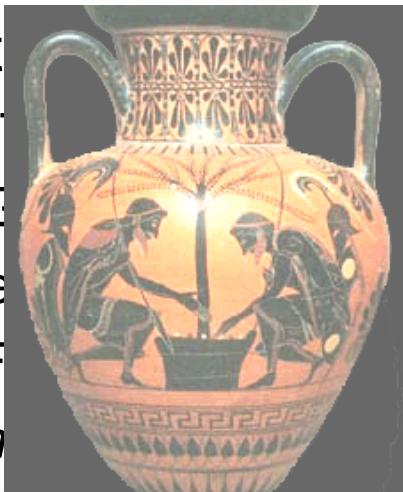

- ‘...the boundary between modern times and the past is the mastery of risk...’ *Against the Gods*, Bernstein

Games of Chance and other Rational Decisions

- And the...
- Ajax and Achilles playing dice on the Iliad
- While the Iliad has been a classic for thousands of years, it has always been games of chance, the desire to win, and the outcome is a modern obsession.
 - the Greek vase painting on the left venture into an exploration of probability
 - More than a game, it was a way of worldview than ability
 - From the Iliad to the Iliad, the repeating cycles of disarray seemed the norm
 - *Game of the Gods* (Gods of God (http://crapsdicecontrol.com/craps_disciples.htm))

Of Chance Today and Tomorrow

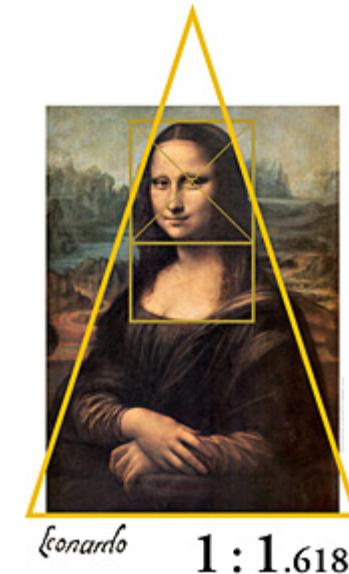

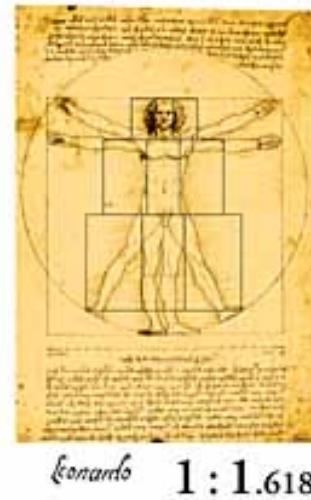

- There is **one** other seemingly insignificant, but essential ingredient regarding risk, probability and decision making that distinguishes our world from past cultures.
- Numbers...
 - We are a world immersed in numbers
 - Even tomorrow must have a number
 - Tomorrow is no longer a mystery
 - Just another turn of the clockwork
- Not possible prior to 500 A.D.
 - Hindus developed the modern numbering system
 - Before that, number systems were based on letters of alphabet
 - Calculations were essentially impossible ($MV - X = ??$)
 - No concept of “zero” – only useful in abstractions/calculations

0 1 2
3 4 5
6 7 8 9

The Power of Counting (Middle Ages)

- In the west – 1202 - *Book of the Abacus* or *Liber Abaci* by Leonardo Pisano in Italy (known as Fibonacci)
 - the breeding of rabbits => Fibonacci series - “the golden mean”
 - THE FIBONACCI SERIES AND THE FINANCIAL MARKETS
 - <http://www.luckymojo.com/fibonaccimkt.html>

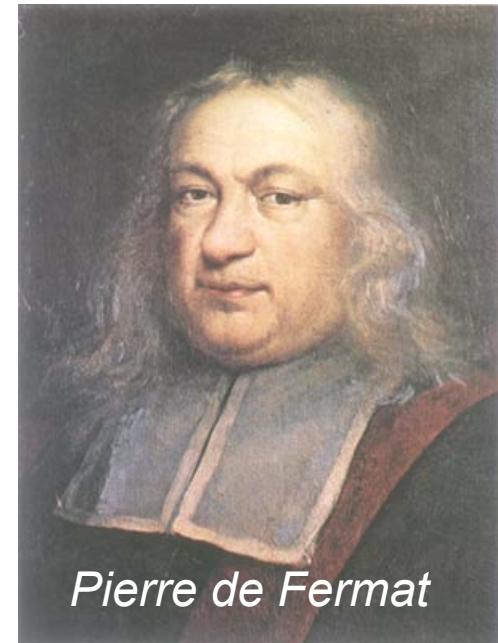

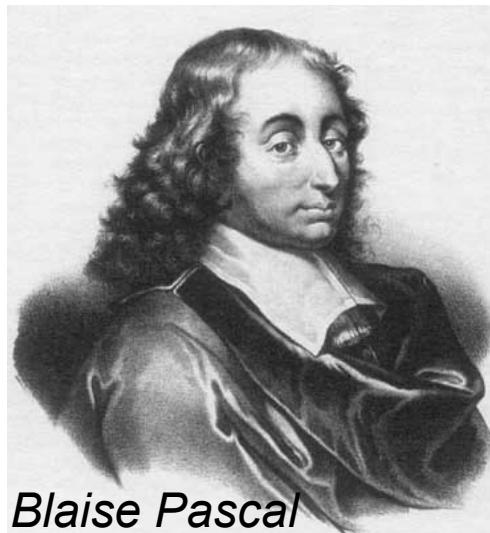

- In 1494 Luca Paccioli, a Franciscan monk, posed a puzzle:
 - “How to divide the stakes in *balla*, if game terminated early?”

The rule of chance, law and decision (1600s)

- 1600s: Solving Paccioli's dilemma: Pascal and Fermat
 - What is *likely* to happen when more things *can* happen then *will*
 - Pascal's Wager regarding belief in God
 - Decision theory

	Belief	Disbelief
God	+	-
No God	0	0

- The first application of “utility” in 1662:
 - Pascal's Port-Royal monastery: *Logic, or the Art of Thinking*
 - “Fear of harm ought to be proportional not only to the gravity of the harm, but also to the probability of the event.”

The past is the key to the future (1700s)

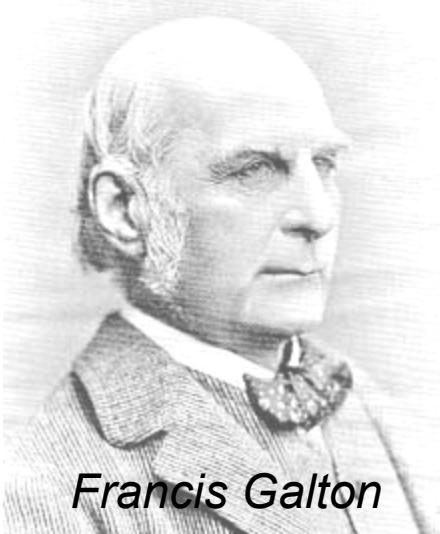

- Jacob Bernoulli, *The Art of Conjecture*, 1713
 - Law of Large Numbers (independent and random events)
- De Moivre: *independent* elements distribute about mean
- Daniel Bernoulli, 1738: the perception of utility
 - "... any small increase in wealth will be inversely proportionate to the quantity of goods previously possessed."
- Jacob: probabilities are not fixed for the events of life
 - risk cannot be managed completely *a priori* (prior to the event)
 - probabilities for life events can only be estimated *a posteriori*
- Thomas Bayes, 1764: first measurement of uncertainty
 - Uncertainty occurs when probabilities are unknown
 - Using new information to revise probabilities (reduce uncertainty)
- Laplace, 1809: "the central limit theorem"

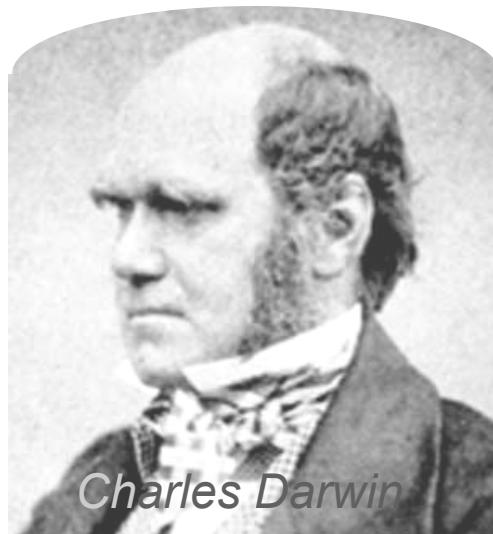

The Victorian Hope – the End of Risk (1800s)

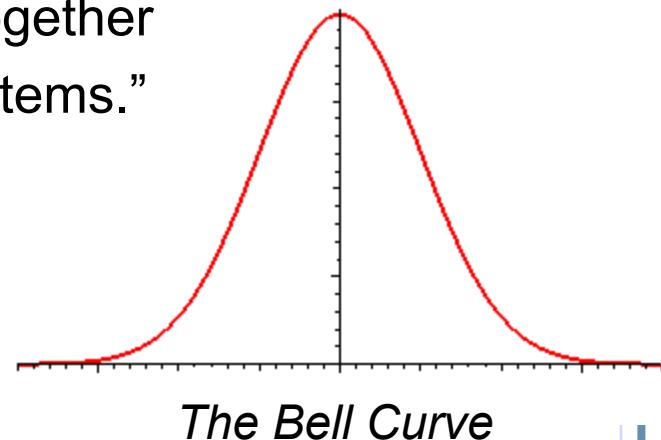

- Francis Galton: the message of the bell curve
 - Normal distribution => data belonged together
 - No normal distribution => “dissimilar systems.”

Francis Galton

Charles Darwin

- Quetelet: analyzed 1829 census => “the average man”
- Galton: superiority of favored classes => social positivism
 - discovered that eminence does not last long
 - Paper, 1877, “regression to the means”

Consistently Irrational (the modern era)

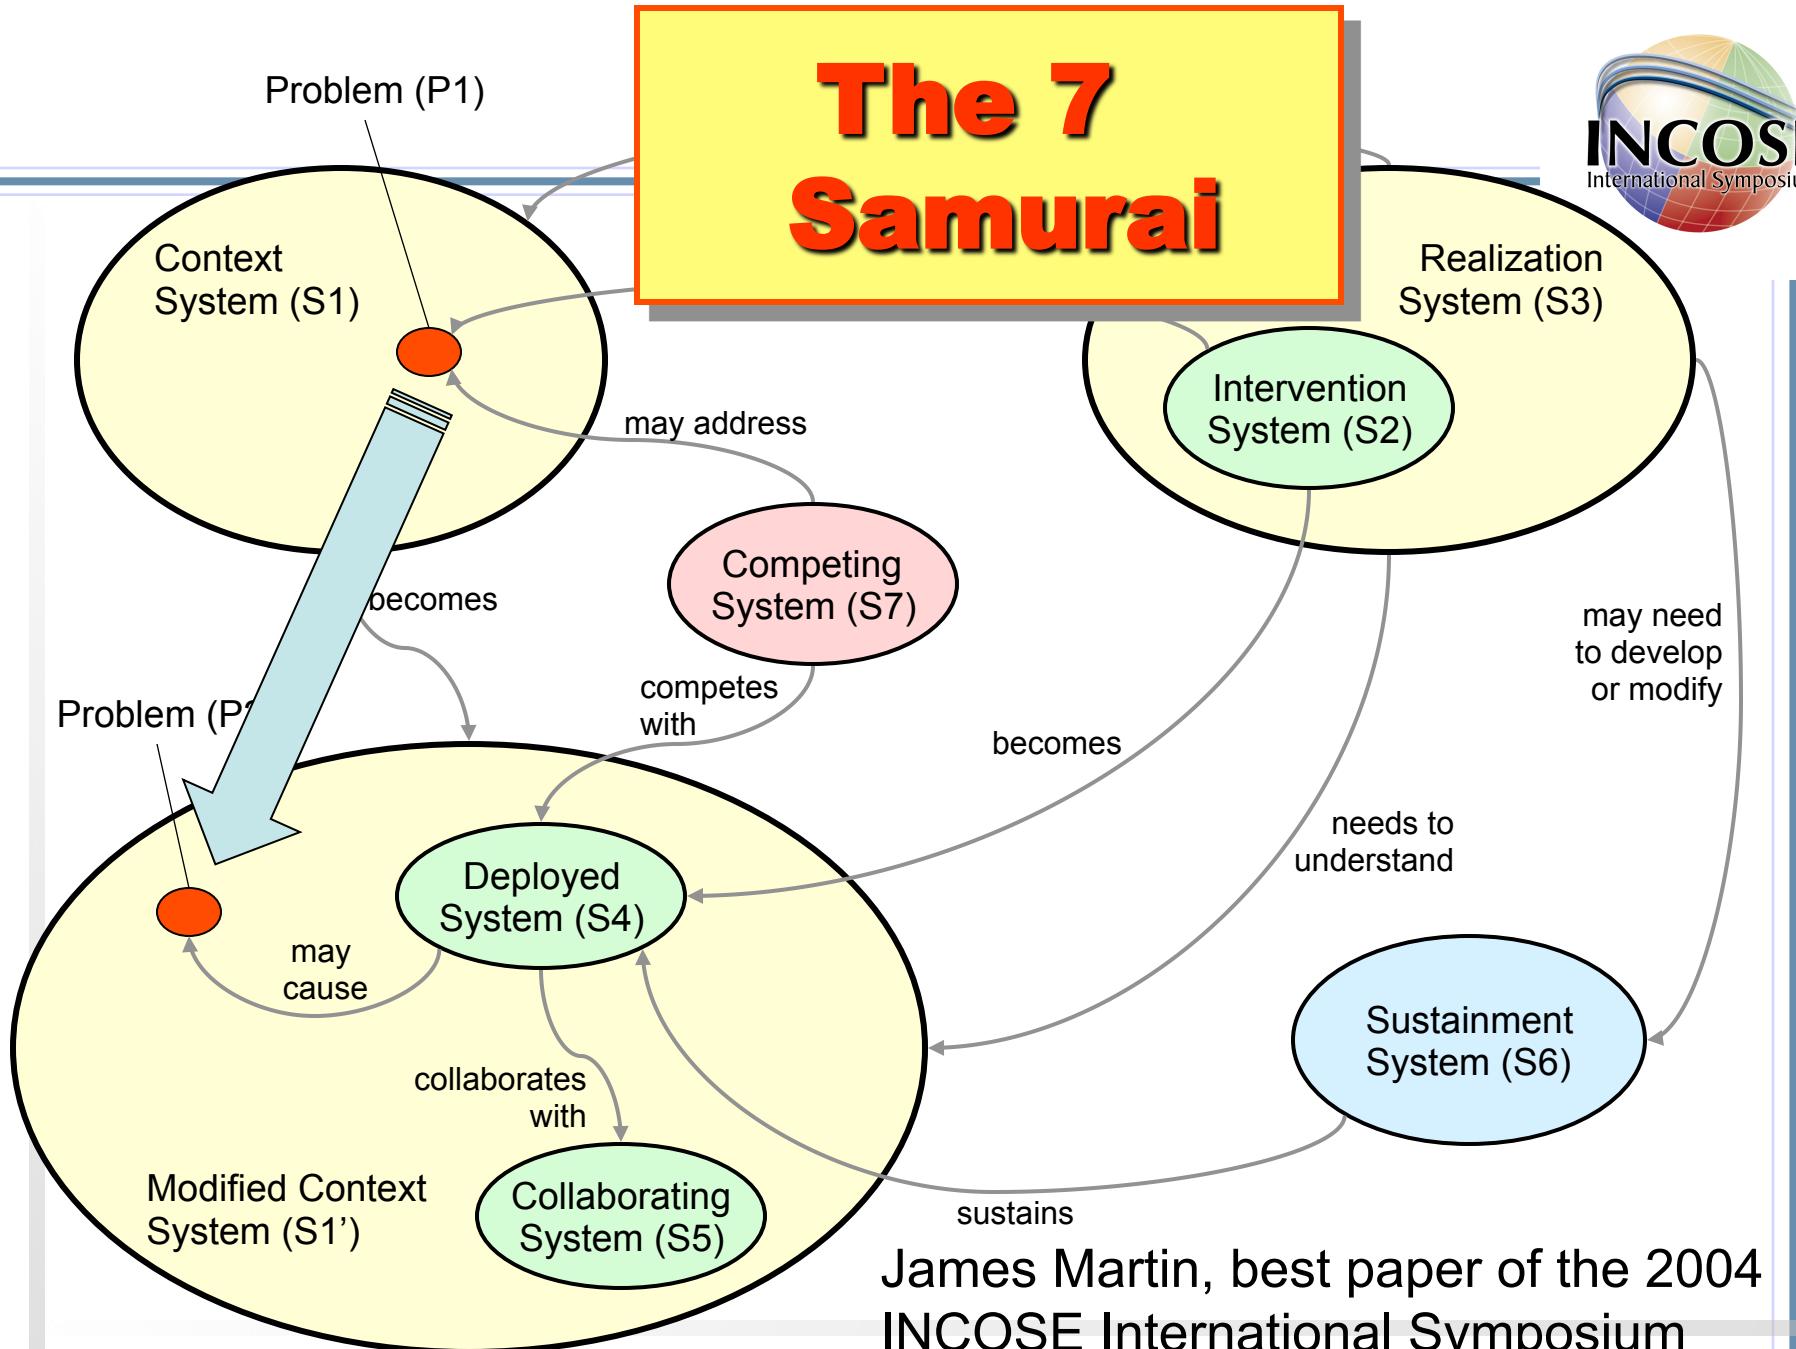

- The Victorians had a pervasive conviction of the underlying rationality of human decision making
- People do not consistently make decisions on the basis of what should rationally be in their own best interest
- Prospect Theory => most people are “loss averse”
 - Perverse tendency to cling to mistakes rather than move on
- People compartmentalize rather than view whole
 - Sub-optimize particular conditions or accept unnecessary losses
 - Unable to see how sub-scale level affects the overall situation
- Unaware that numerous biases influence decisions
 - Freshness of data, vividness of descriptions, multiple elements
- Aversion to uncertainty or ambiguity, except...
- Slavish adherence to the normal distribution is unwise

INCOSE International Symposium

Managing Risk – the Never Ending Story

- Certainly, there will always be uncertainty and risk.
- If there is substantial risk, no single answer is sufficient.
- Probability based on data, OK when events independent
- Otherwise: mix of probability, Bayesian analysis, bias analysis, other techniques (e.g. design resilient systems):
 - identify the upset, adapt and make appropriate changes
 - isolate/neutralize offending input and any “infected” subsystem
 - operate at reduced efficiency until fix is implemented
 - if catastrophic failure undesired, perform controlled shut-down
- Risk management is ongoing process in development deployment, operations, upgrades & system replacement
- Pause during midst of a difficult project, think about risk, and consider that *you* may be a part of the problem.
