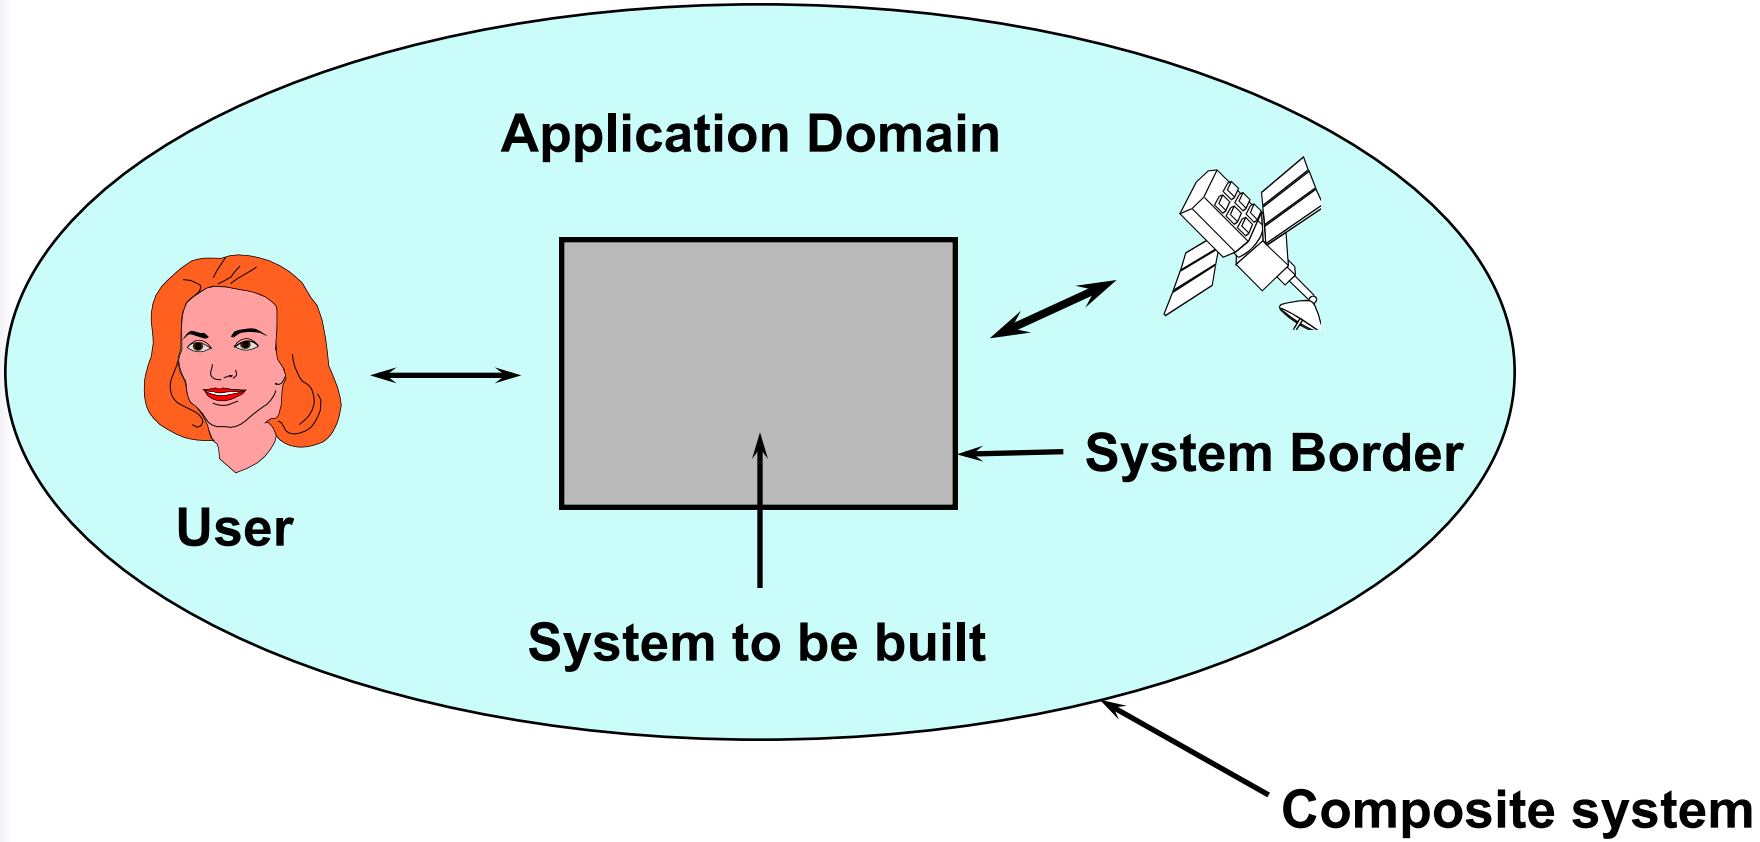
System overview



Outline

- Background
- Functions / tasks, goals, scenarios / use cases
- Requirements and object-oriented models
- A systematic design process
- Scenarios / use cases for interaction design
- Summary and Conclusion

What are requirements?

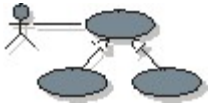
- User wishes / needs
- *IEEE Standard:*
  "A condition or capacity needed by a user to solve a problem or achieve an objective."
- "The <*system*> shall be able to ..."
  - system to be built
  - composite system
- *Example:* "The ATM shall accept a cash card."
- Requirements modeling

Scenarios – Stories and narratives

- For representation of
  - cultural heritage
  - explanations of events
  - everyday knowledge
- Human understanding in terms of specific situations
- Human verbal interactions by exchanging stories

Use cases

- "particular cases of how the system is to be used"
- Use-Case Report (according to Unified Process):
  1. Brief Description
  2. Flow of Events
  3. Special Requirements
  4. Pre-conditions
  5. Post-conditions
  6. Extension Points
  7. Relationships
  8. Use-Case Diagrams
  9. Other Diagrams



Use-case diagram

- - Ellipse: use case

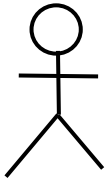
Name of use case

- Stick man: actor



Name of actor

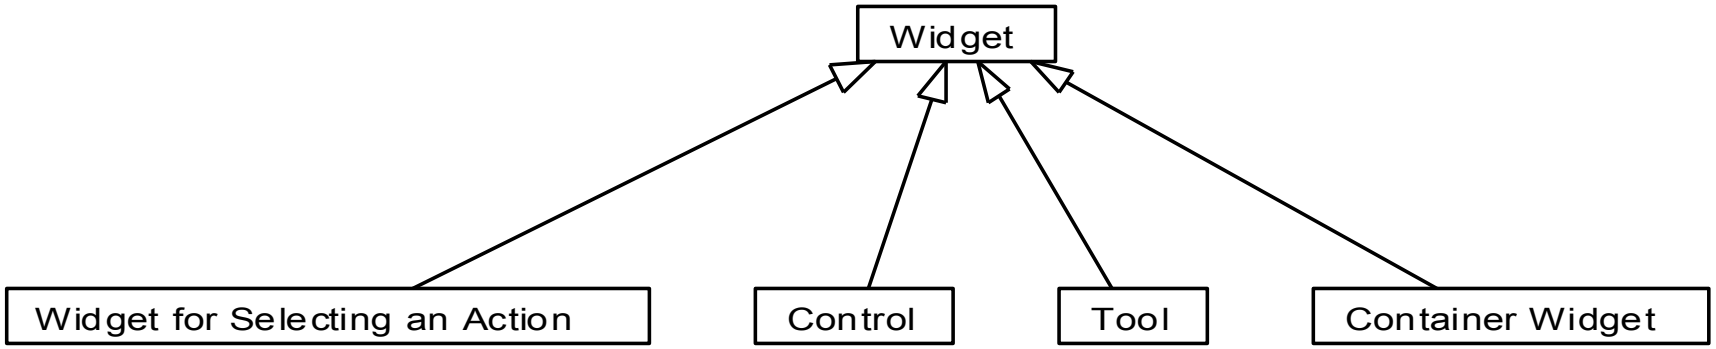
- Connecting line: association

Interaction design

- Design of interactions between human and computer
- Relation to requirements engineering
- Relation to task analysis
- No commitment to specific user interface

Widgets

- Interactive objects presented on the display
  - windows
  - buttons
  - scroll bars
- User interface elements
- Classification hierarchy of widgets



Outline

- Background
- Functions / tasks, goals, scenarios / use cases
- Requirements and object-oriented models
- A systematic design process
- Scenarios / use cases for interaction design
- Summary and Conclusion

Glossary

Scenarios: “sequences of actions aimed at accomplishing some task goal”

Goals: “partially specified states that the user considers as desirable”

Use cases: “particular cases of how the system is to be used”, “classes of scenarios”

Functions: “effects achieved by some entity”

Tasks: “pieces of work that a person or other agent has to (or wishes to) perform”

Functional requirements

- Describe required functionality not yet available
- Functional user requirements may be high-level statements of what the system should be able to do.
- Functional software/system requirements should describe the functions of the software/system to be built in detail (but not yet its design or implementation).

Scenario – Video Store Example

Rent Available Video:

A member of the video store identifies himself/herself to VSS (Video Store Software).

VSS shall check the identification.

If the identification is successful, VSS shall start a transaction and present a selection of video titles.

The member selects a video title that is available and indicates the intent to rent (a copy of) the video.

Scenario – Video Store Example (cont.)

VSS shall book this rental on the account of the member and ask the clerk to hand out a video copy to the member.

The clerk hands out a copy of the video title and acknowledges this to VSS.

VSS shall again present a selection of video titles.

The member does not select further titles, but initiates the termination of the transaction.

VSS shall issue a good-bye message and terminate the transaction.

By-Function – Video Store Example

A member of the video store identifies himself/herself to VSS (Video Store Software).

VSS shall check the identification.
By-Function:

...

VSS shall book this rental on the account of the member and ask the clerk to hand out a video copy to the member.
By-Function: Video Rental Booking
Video Handing-out Request

...

Functional requ. – Video Store example

Rent Available Video By-Function Video Rental Booking

Video Rental Booking:

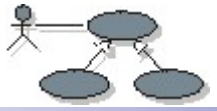
VSS shall book the rental of a copy of a video title on the account of the member, and reduce the number of available copies of the video title by 1.

Goal – Video Store example

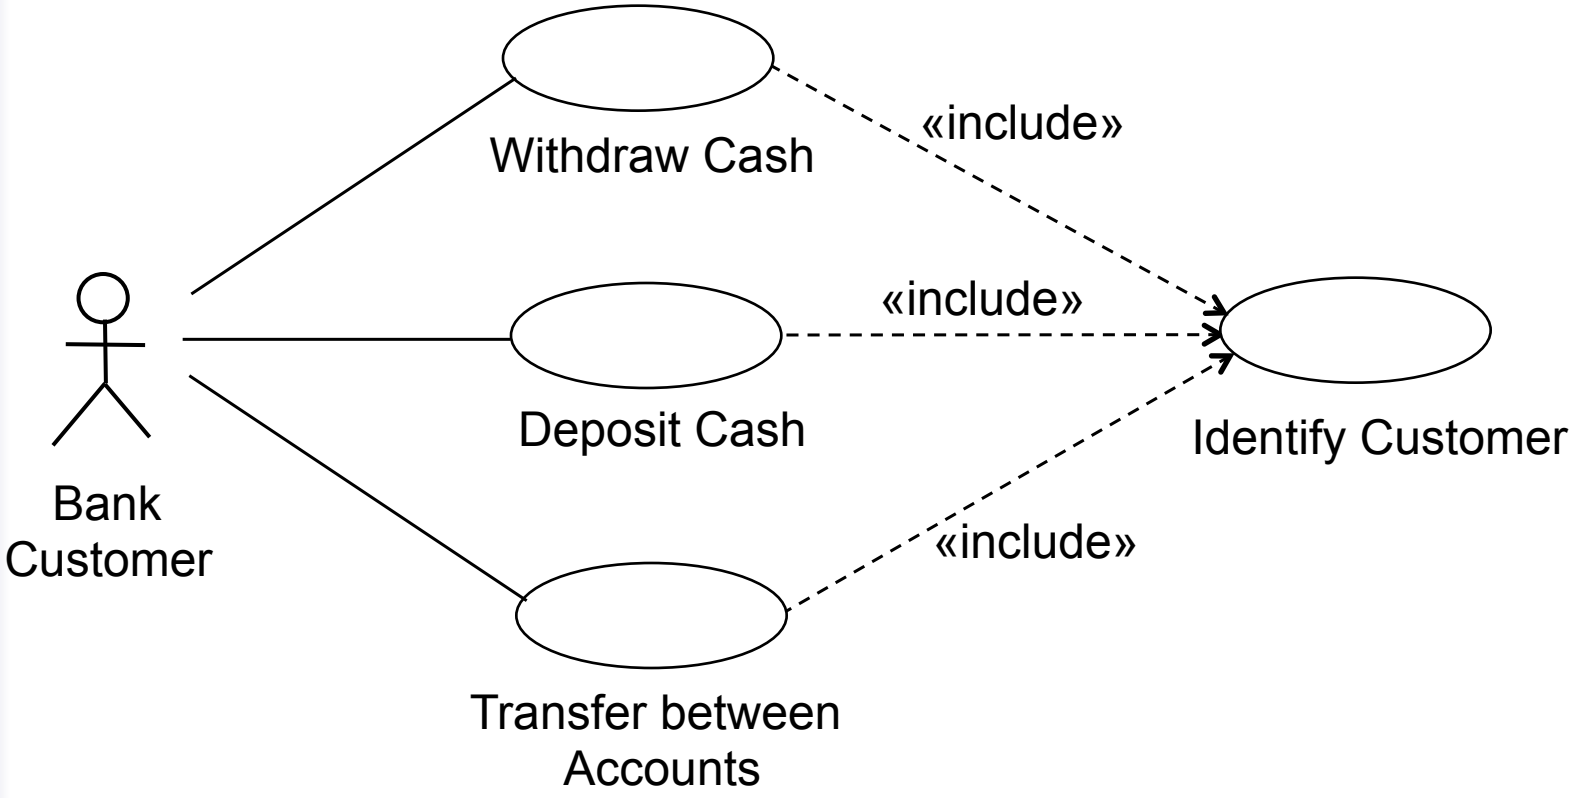
Member Has Video for Rent By-Scenario Rent Available Video

Member Has Video for Rent:

A member of the video store has a copy of a video title from the store for rent.



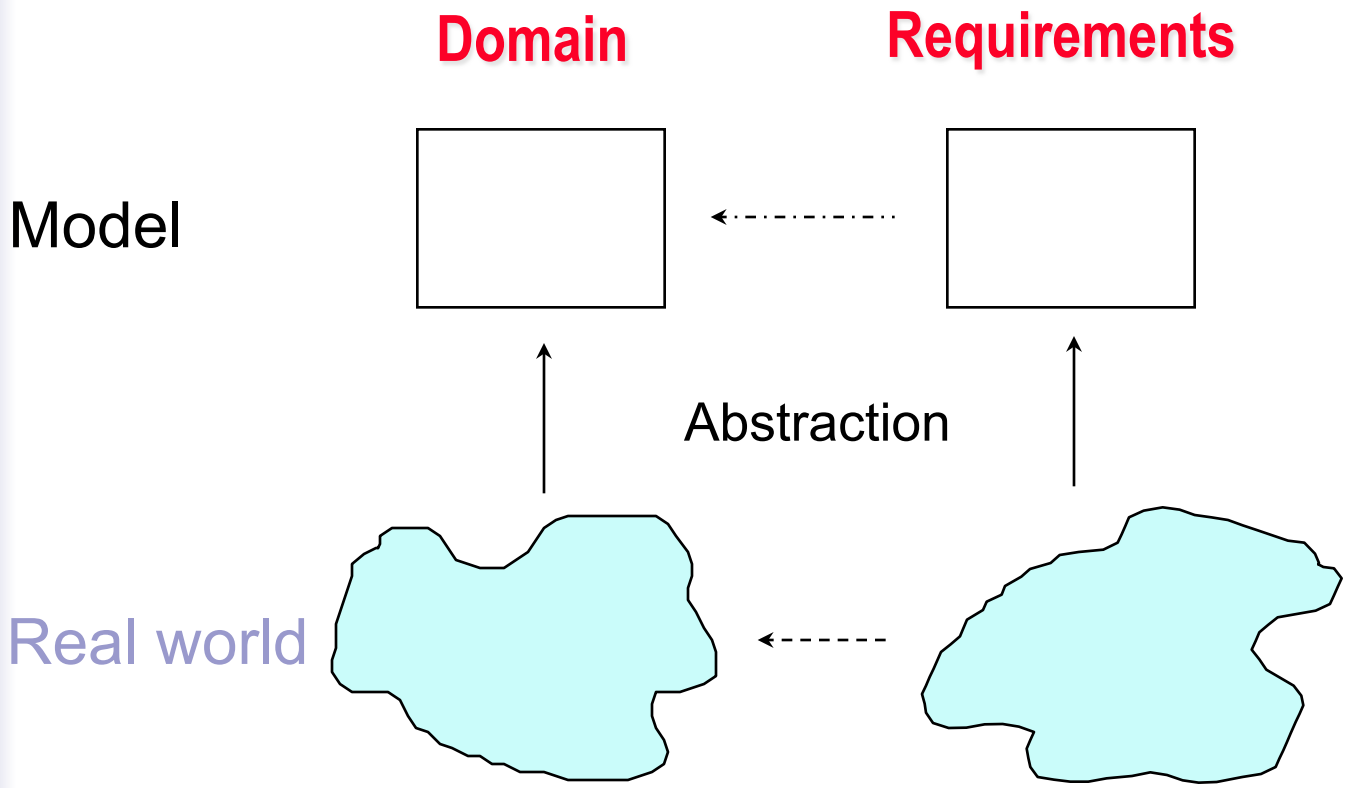
Use-case diagram



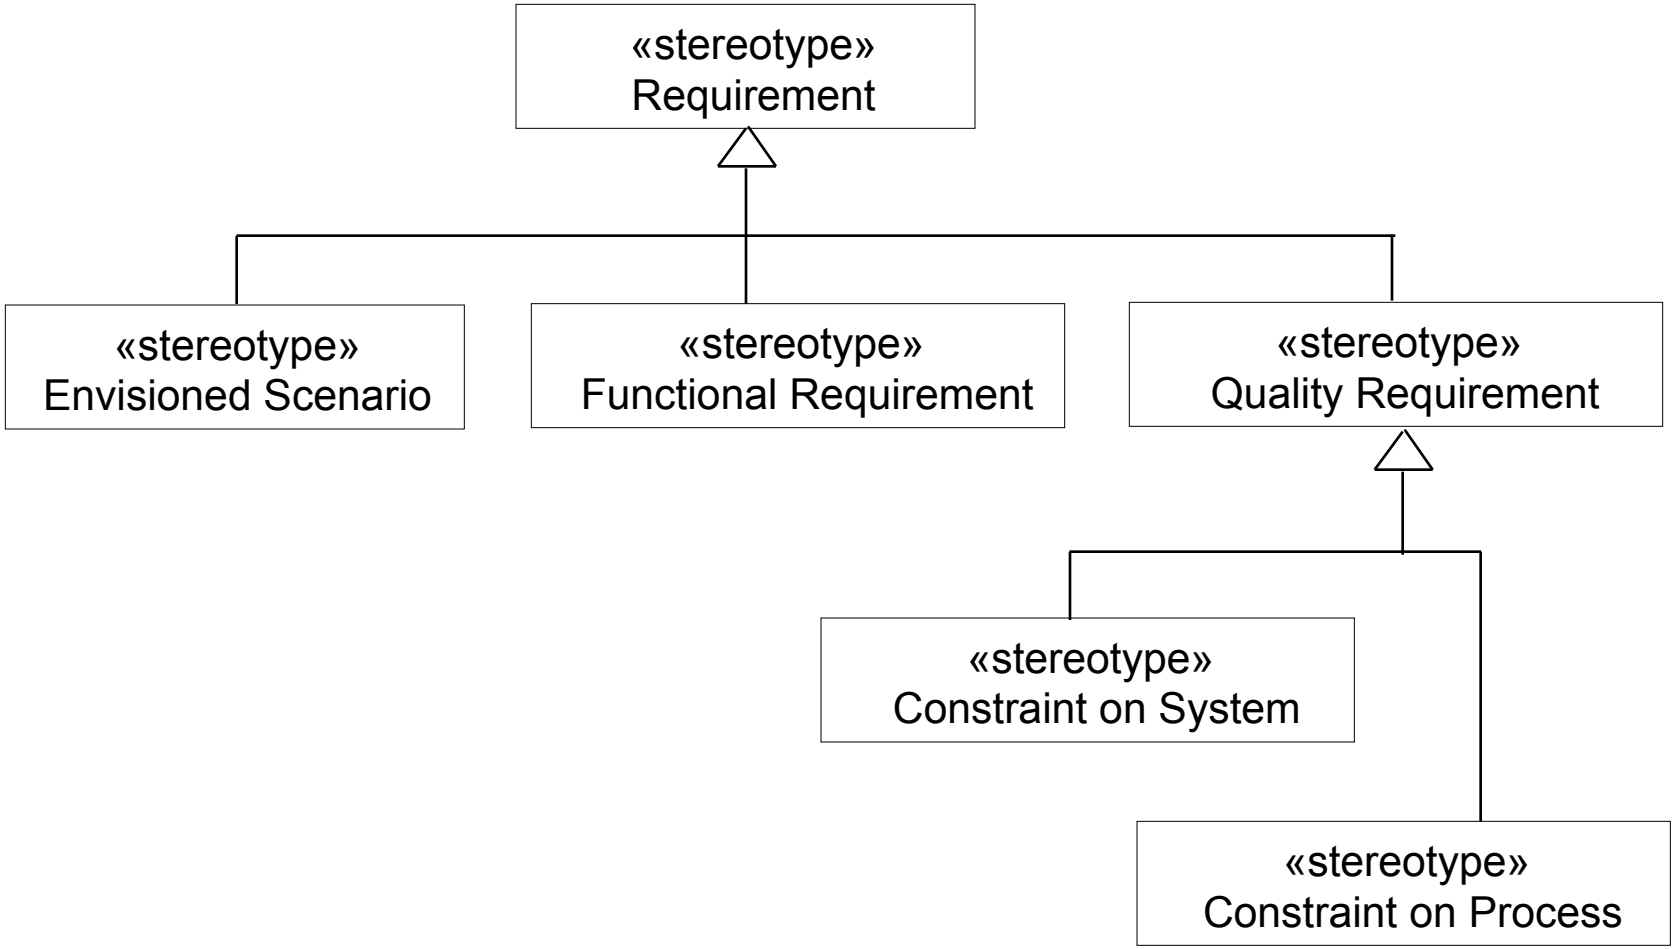
Outline

- Background
- Functions / tasks, goals, scenarios / use cases
- Requirements and object-oriented models
- A systematic design process
- Scenarios / use cases for interaction design
- Summary and Conclusion

Requirements and object-oriented models



Types of requirements



Types of requ. – Constraints on system

- Performance
- Reliability
- Security
- Safety
- Portability
- Maintainability
- Reusability
- Interface
- Usability

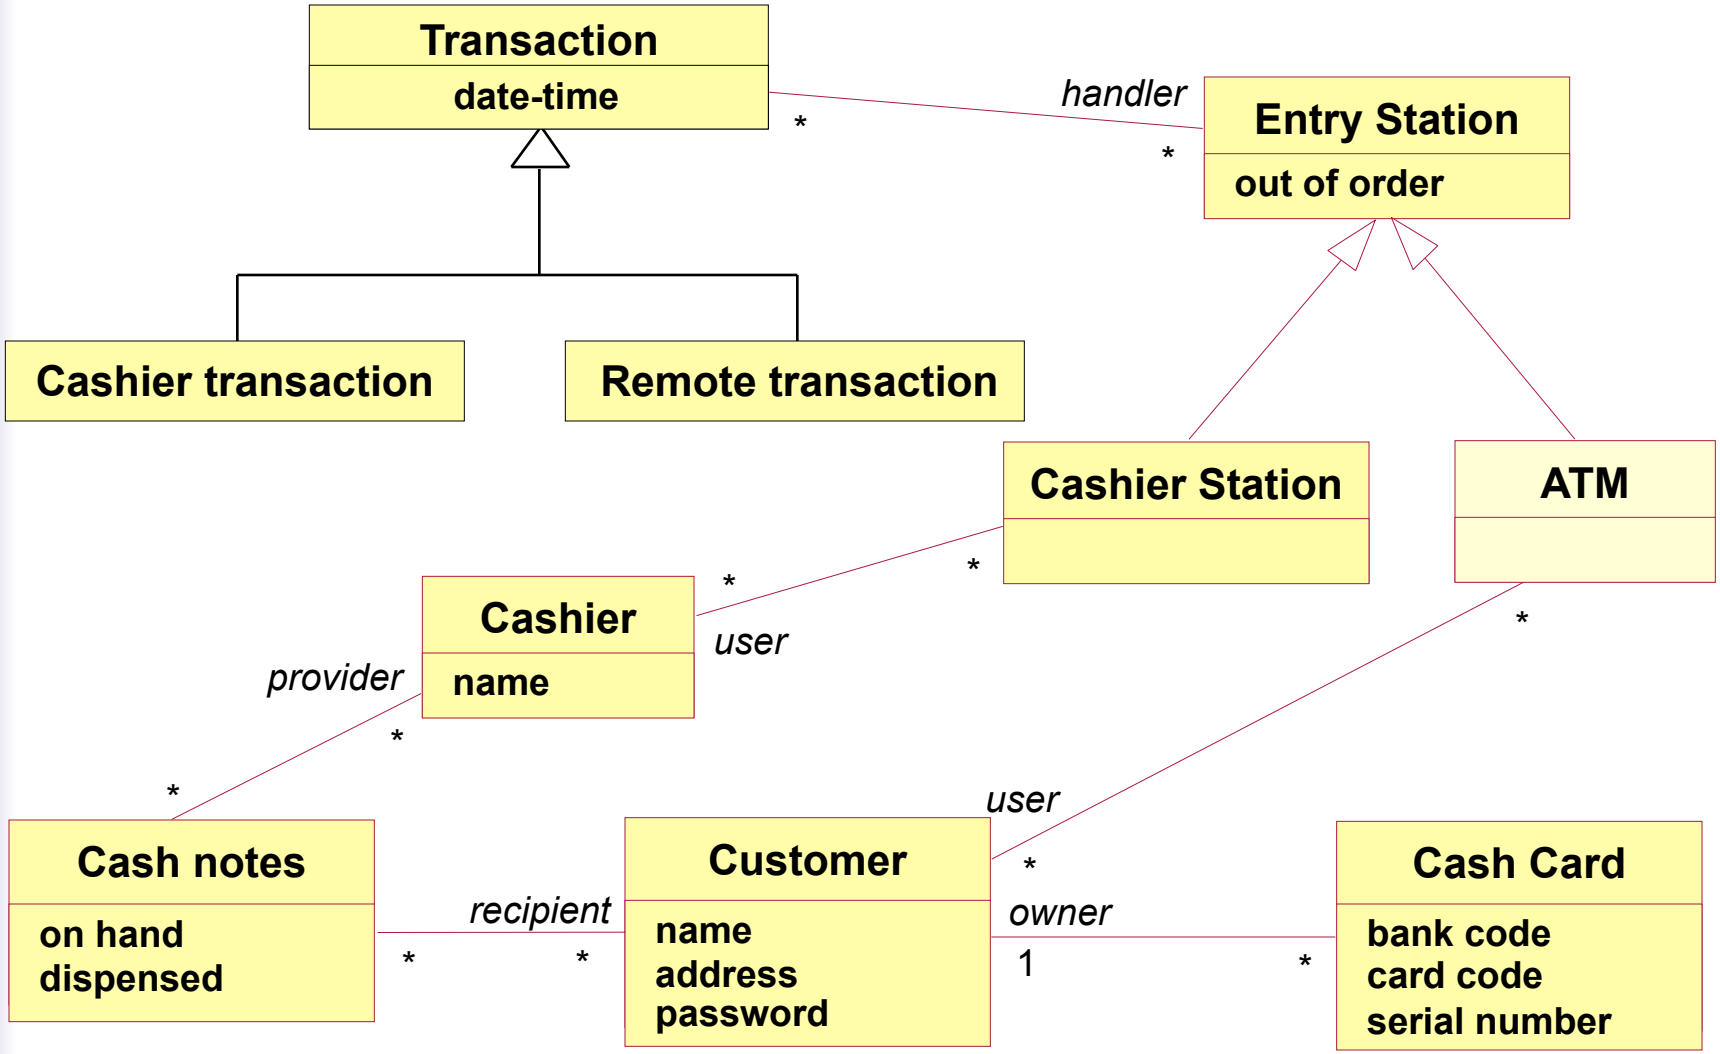
Types of requ. – Constraints on process

- Specific development process to follow
- Specific programming language for implementation
- Specific tools to be used
- Specific hardware to be used
- Political issues
- Time to market
- Terms of delivery
- Cost

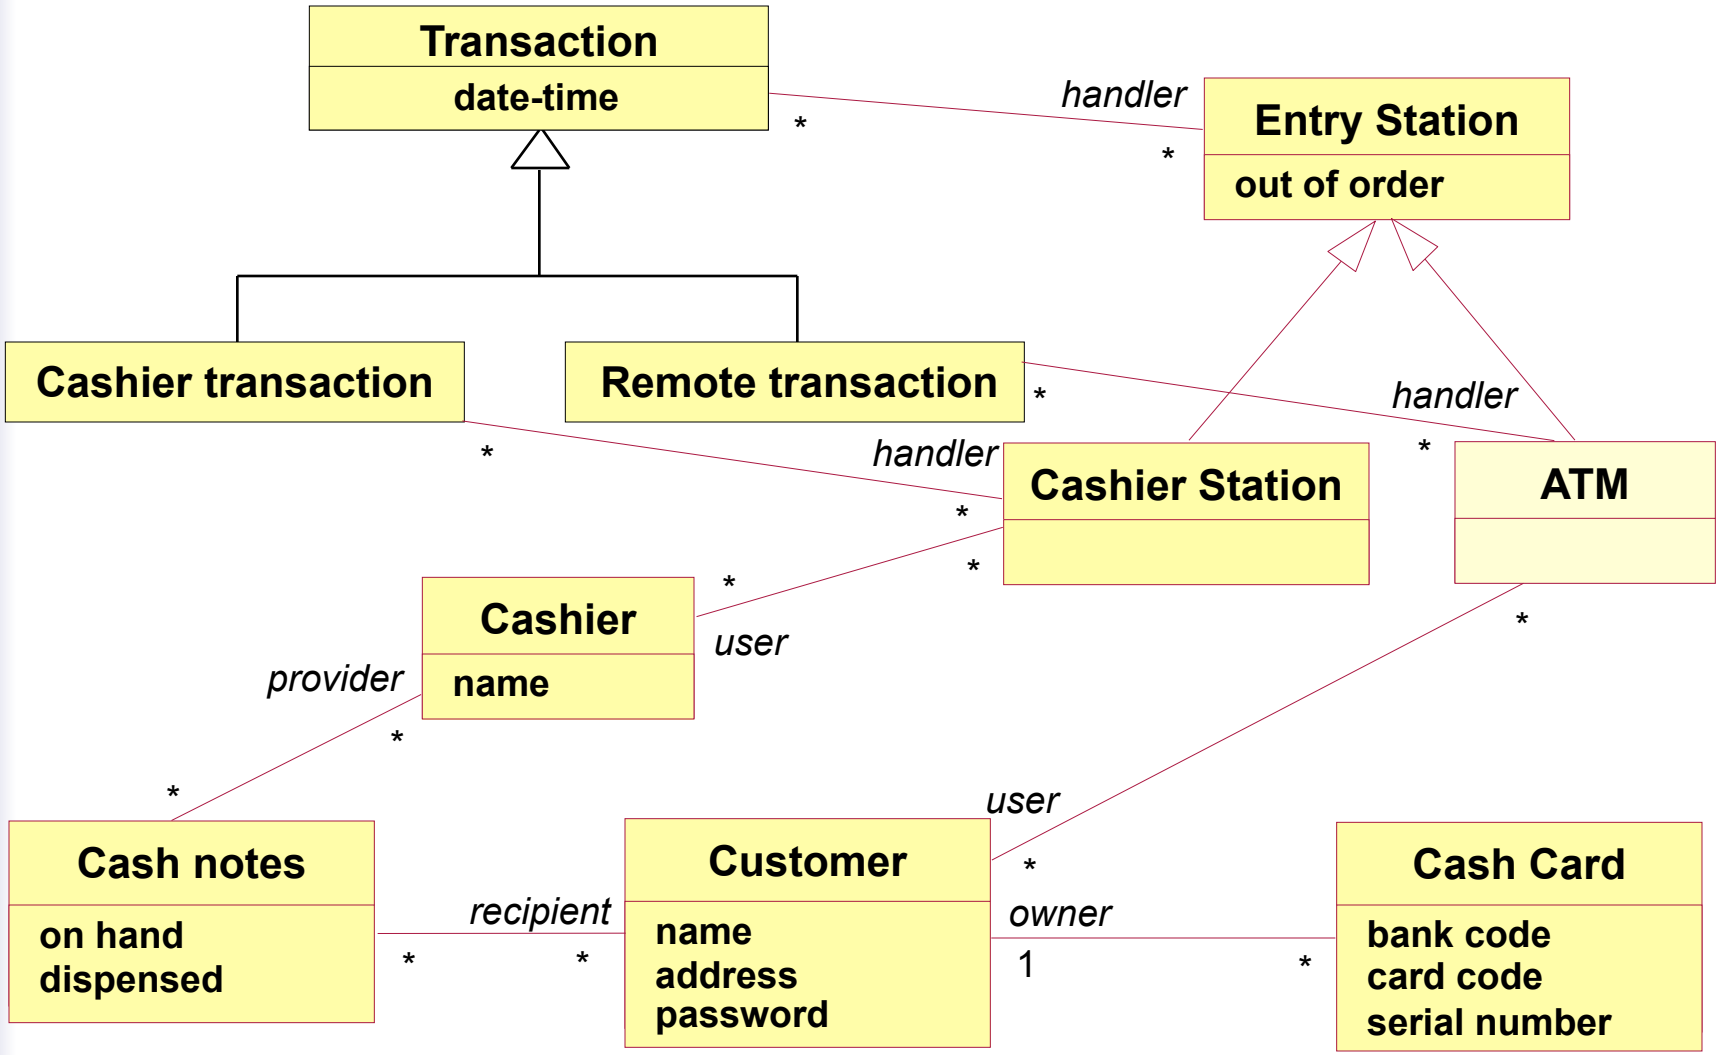
Conflicts between Quality Requirements

- VSS example
  - VSS shall allow direct access to member data.
  - VSS shall protect member data from illegal access.
- Usability vs. Security
- Trade-off
- Common in complex systems

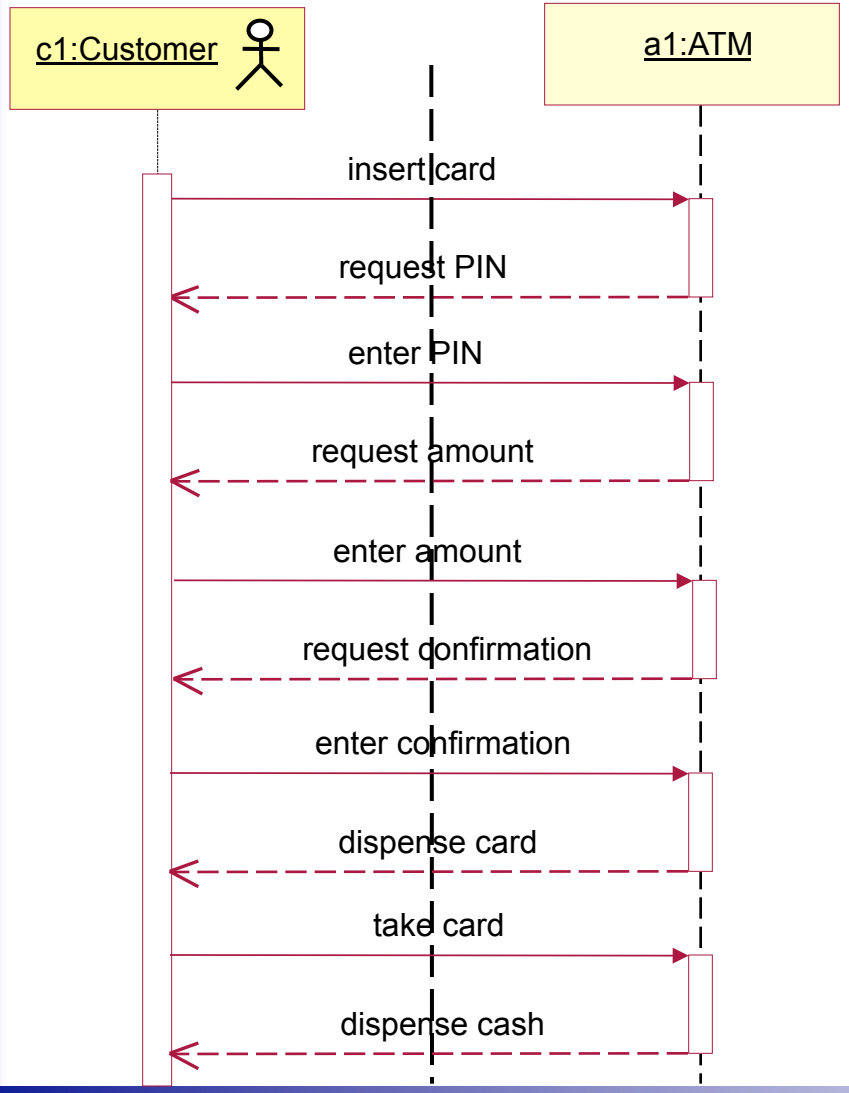
OOA model – ATM Example



OOA model adapted – ATM Example

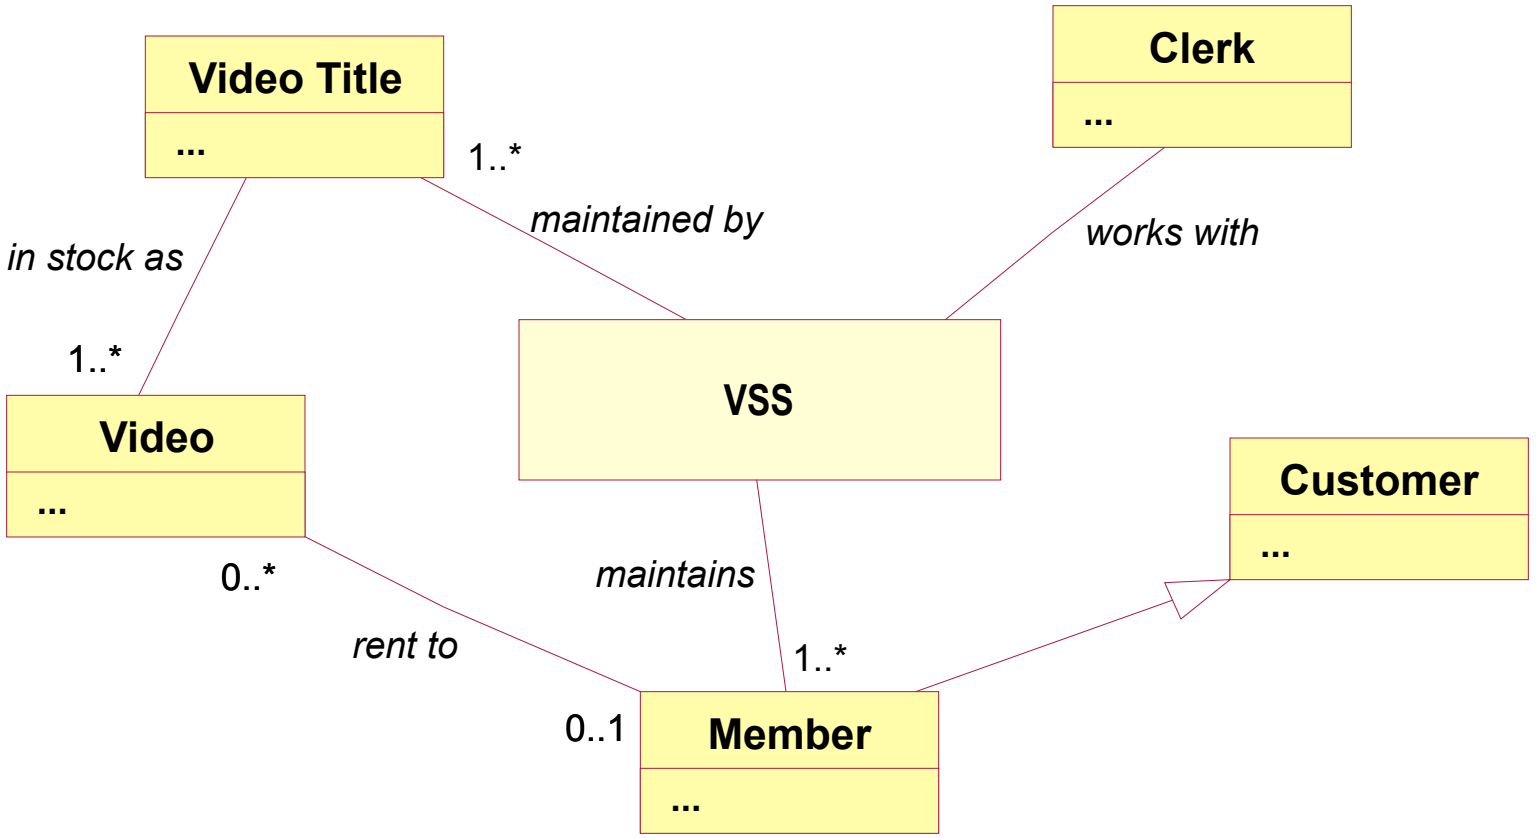


OOA model – UML sequence diagram

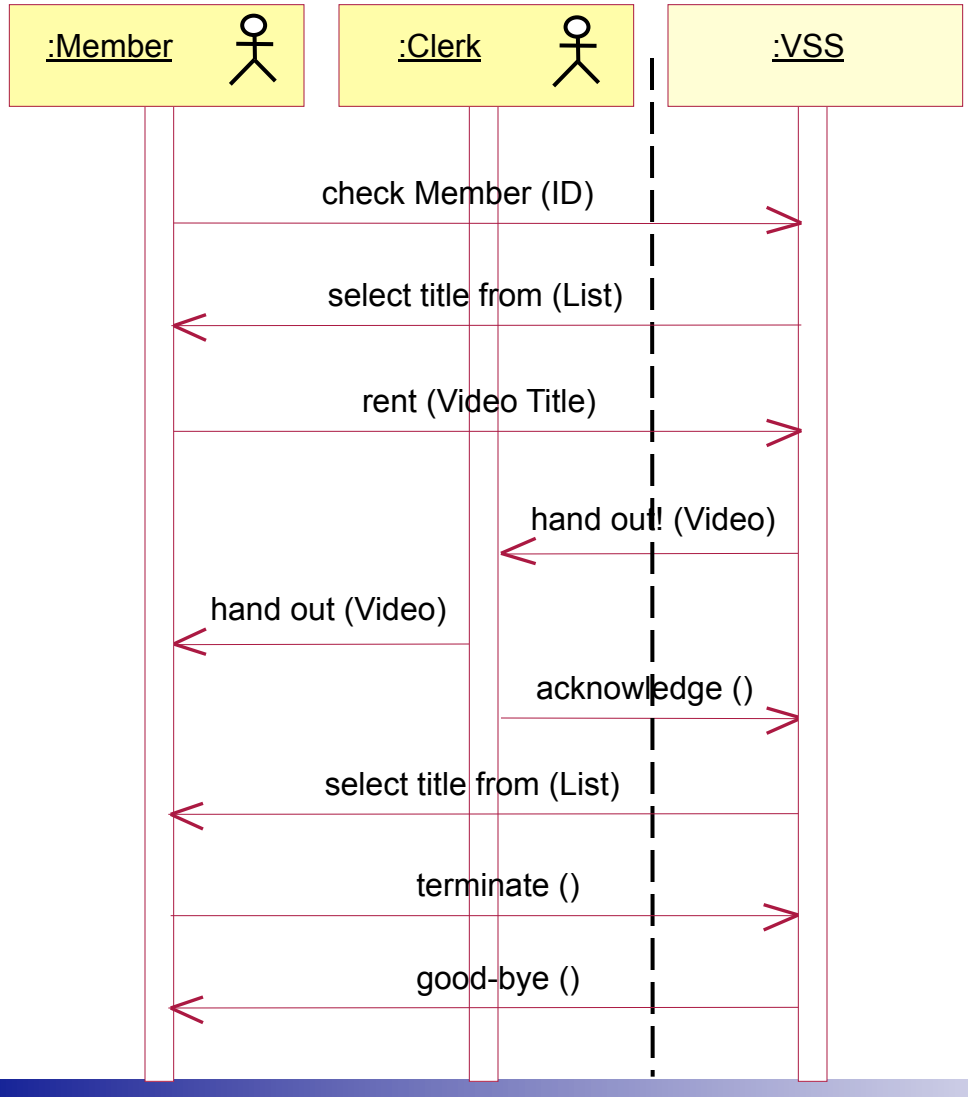


- Represents a scenario
- Interaction of instances
- Activation
- System border

OOA model – Video Store example



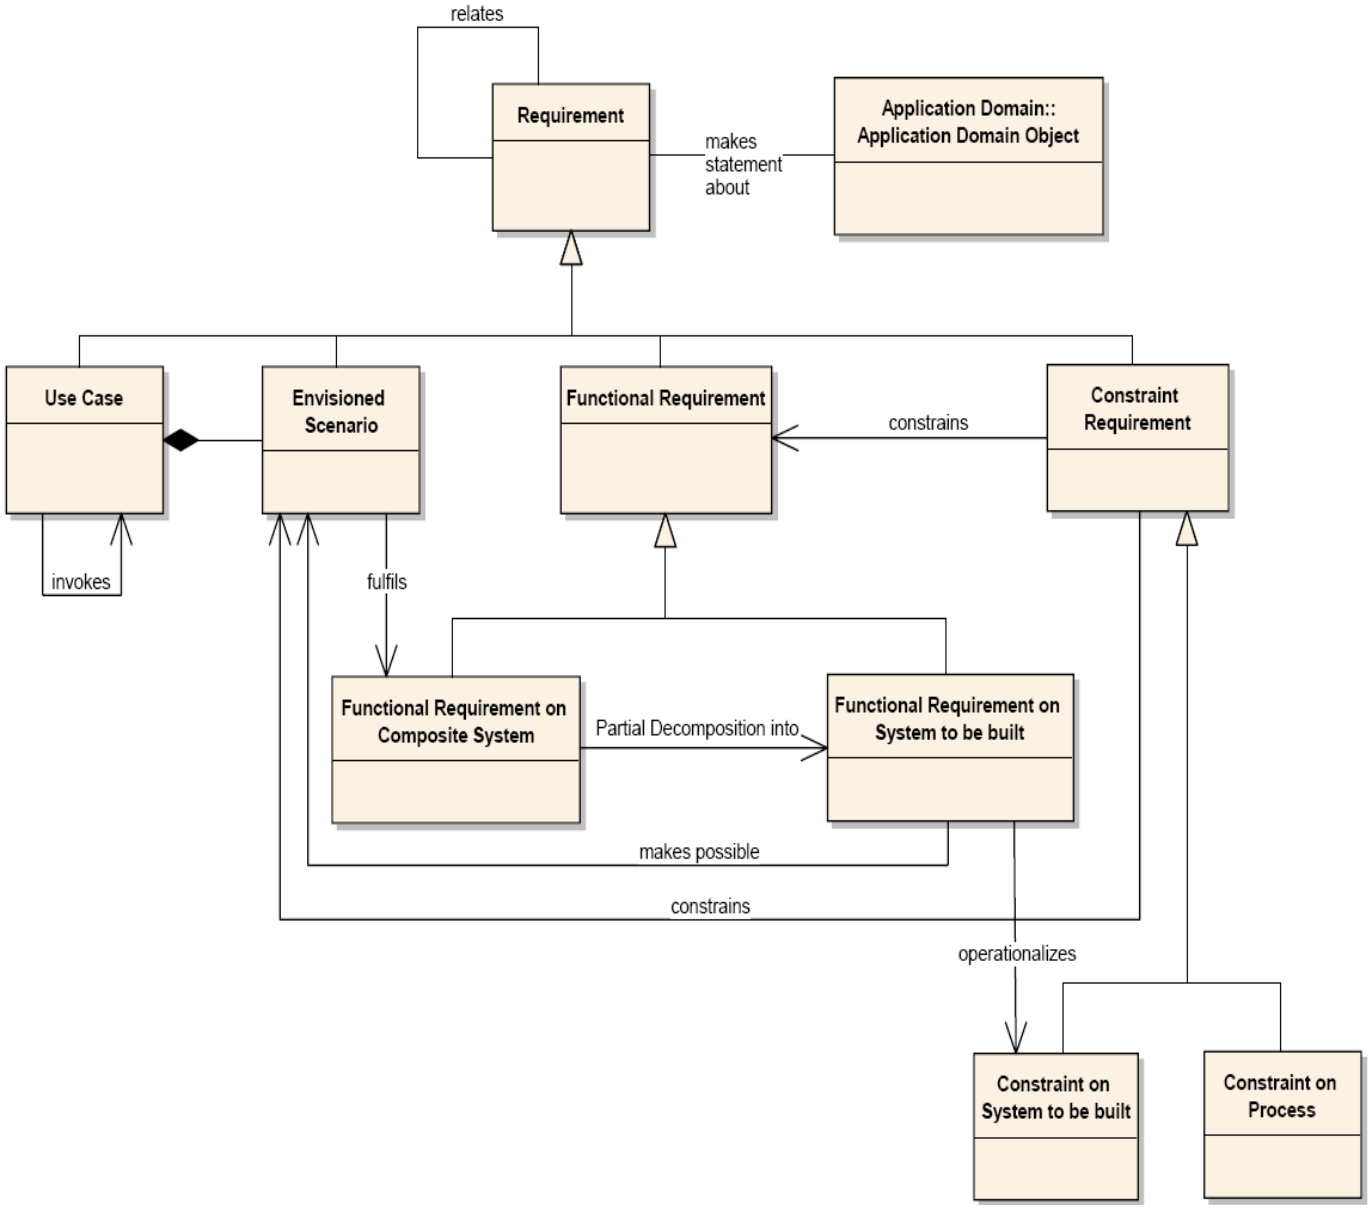
OOA model – UML sequence diagram



Unnamed instances

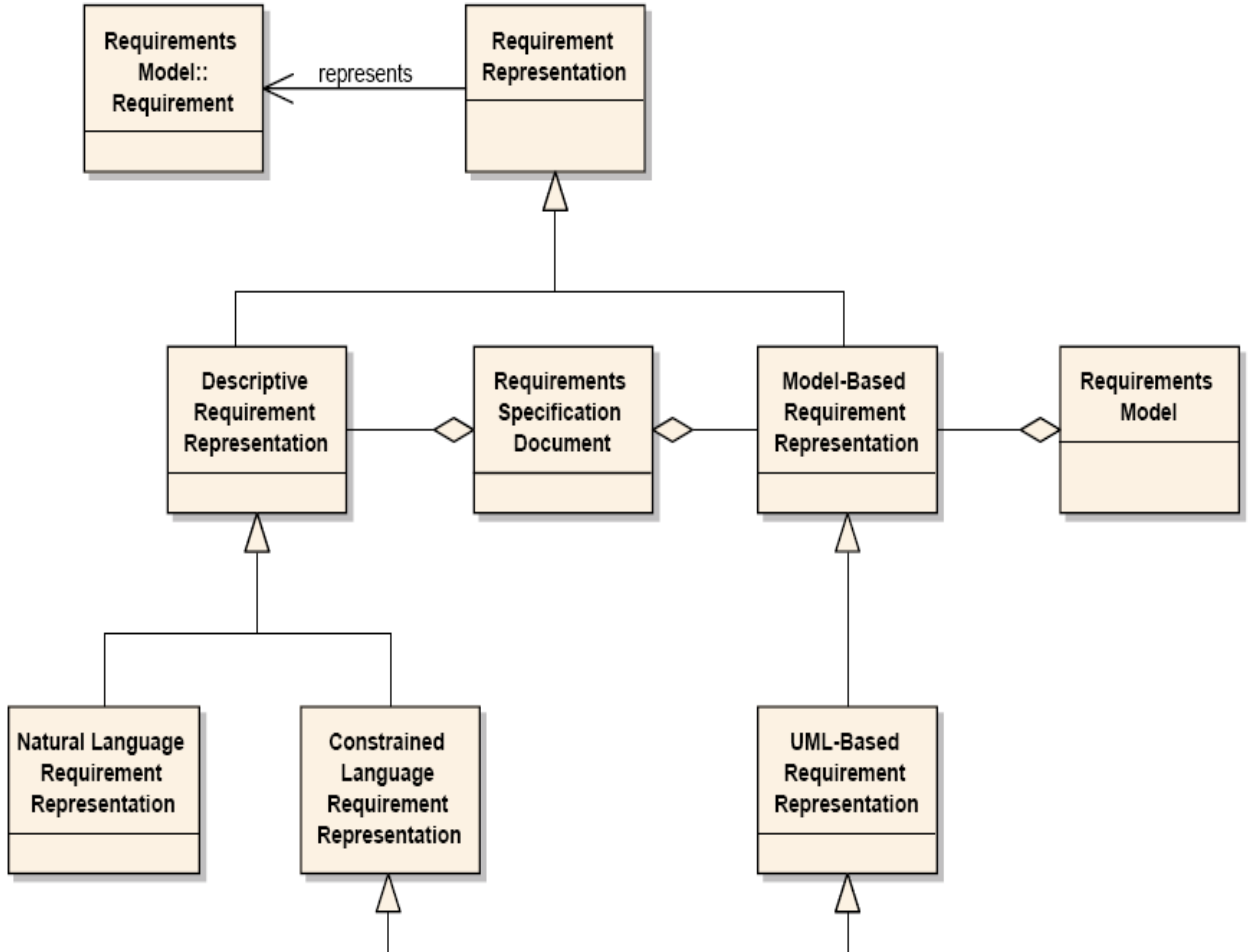
Concurrent objects

Conceptual model



Requirements vs. requirements representation

- Reuse of requirements representation only
- Distinction between
  - descriptive and
  - model-based
- Descriptive: need described
- Model-based: abstraction of what the system should look like



Outline

- Background
- Functions / tasks, goals, scenarios / use cases
- Requirements and object-oriented models
- A systematic design process
- Scenarios / use cases for interaction design
- Summary and Conclusion

Systematic process

Systematic process

Idea: navigation in the metamodel graph

Excerpt:

What is known already?

Old system or system to be built?

Systematic process – Given goals

1. If some goal is known from the old system, then figure out whether this is still a goal in the new system that will include the system to be built.
   E.g., Meeting a Friendly Person, Customer Has Cash.
2. If some goal is known for the new system, then try to link it to one or more scenarios for the new system that are already known.
   E.g., Customer Has Receipt – Get Cash from ATM.
3. If some goal that is known for the new system cannot be linked to any scenario for the new system, then develop one or more such scenarios and link them to the goal.
   E.g., Customer Has Cash – Get Cash from ATM.

Systematic process – Given scenarios

1. If some scenario is known from the old system, then determine the goals that are achieved through it.
   E.g., Get Cash from Human Cashier – Customer Has Cash.
2. If some scenario is known from the old system, then try to develop an analogous scenario for the new system.
   E.g., Get Cash from Human Cashier – Get Cash from ATM.
3. If some scenario is known for the new system, then try to link it to one or more goals and, each action contained in it to one or more functions for the new system that are already known.
   E.g., Get Cash from ATM – Customer Has Cash – Cash Provision.

Systematic process – Given scenarios (cont.)

4. If some scenario that is known for the new system cannot be linked to any goal for the new system, then determine one or more goals and link them to the scenario.
   E.g., Get Cash from ATM – Customer Has Cash.
5. If one or more actions contained in some scenario that is known for the new system cannot be linked to any function for the new system, then develop one or more such functions and link them to the actions of this scenario.
   E.g., Get Cash from ATM – Receipt Provision.

Systematic process – Given functional requ.

1. If some function is known from the old system, then figure out whether this is still a required function in the new system that will include the system to be built.
   E.g., finger prints – Cash Card Acceptance, Cash Provision.
2. If some function is known for the new system, then try to link it to one or more actions contained in scenarios for the new system that are already known.
   E.g., Check Amount – Get Cash from ATM.
3. If some function that is known for the new system cannot be linked to any action contained in any scenario for the new system, then develop one or more such scenarios and link one or more actions contained in them to the function.
   E.g., money transfer between accounts.

Systematic process (cont.)

- Partial sequences of steps selected according to what is known – agenda
- Both model-driven and data-driven
- Successful termination – agenda empty
- Improvement of
  - Completeness
  - Non-redundancy
  - Understandability
- But no guarantee

Guide -- Representing a Scenario
Please try to follow the instructions in sequence, where the one highlighted through a white background is the current one.
Note: Whenever an instruction is followed successfully, the subsequent instruction is highlighted automatically. If you do not follow the current instruction, its text flashes. In the case that you need active support, please press the push button "Perform Instruction". The Guide will then perform this instruction on your behalf.
1. Select the class "Scenarios".
2. Create an instance of this class by selecting "Instance..." from the menu "Create".
3. Type an appropriate identifier for this scenario in the pop-up window "Create Instance" and press the push button "Create".
4. Select the scenario instance just created.
5. Select the attribute "Statement" in the right part of the window.
6. Expand its partition content by pressing its push button "+".
7. Switch to the edit mode for this attribute by selecting "Edit Text..." from the menu "Edit".
8. Enter a textual description for this scenario (possibly in analogy to the ATM example scenario given) and finish editing by pressing the push button "OK".
Perform Instruction
Cancel

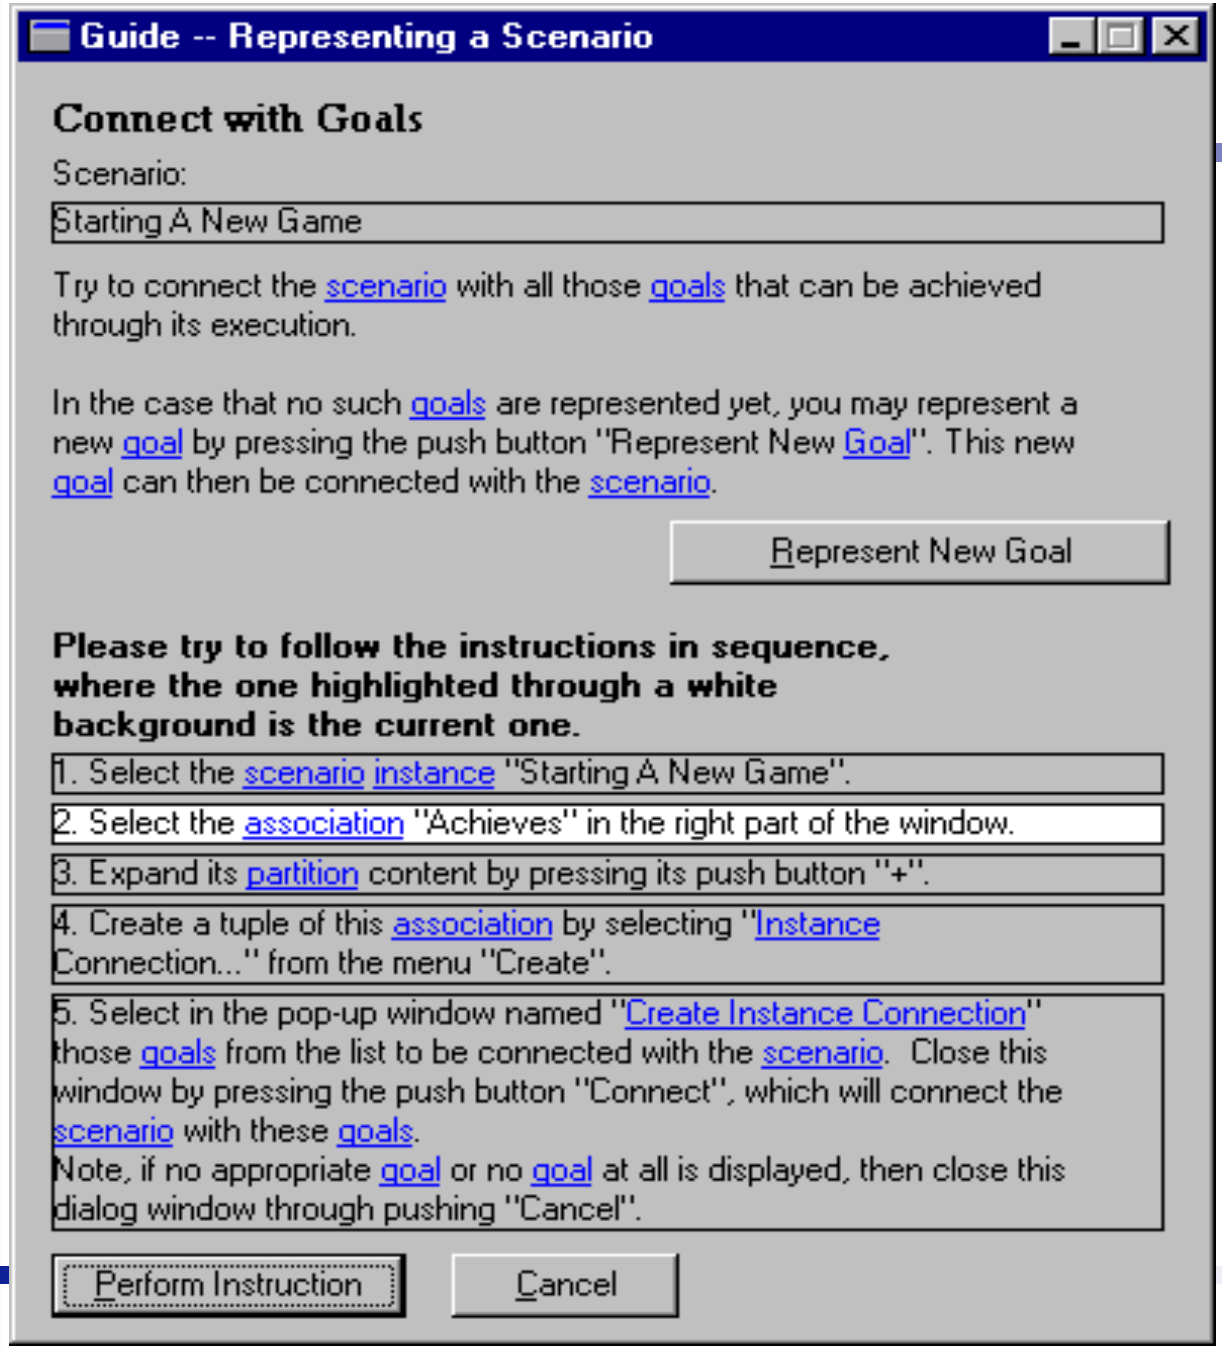
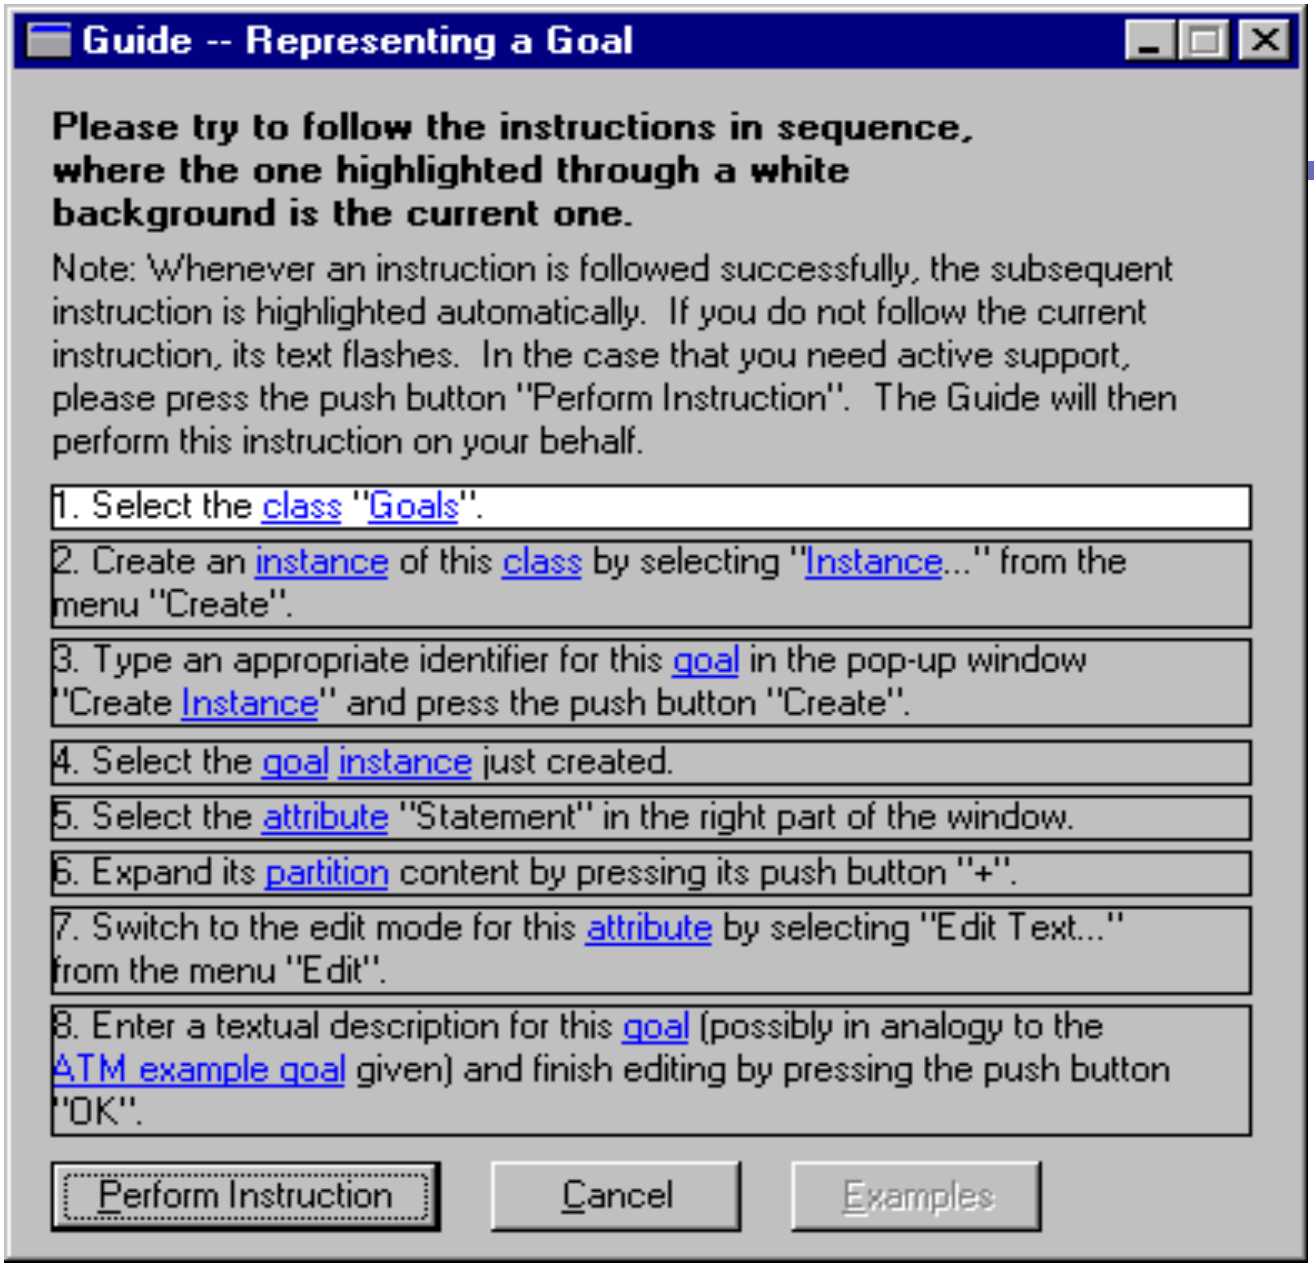
Guide -- Representing a Scenario
Connect with Goals
Each scenario should be connected with at least one goal that can be achieved through its execution.
The underlying idea is to model scenarios that are both necessary and useful. In addition, a scenario may be better understood when some corresponding goal is known.
In the case that a scenario cannot be connected appropriately with any goal that is already represented, either some goals may yet be missing in the representation or this scenario may not serve any goal of the user.
OK



Guide -- Representing a Scenario
Connect with Goals
Scenario:
Starting A New Game
Try to connect the scenario with all those goals that can be achieved through its execution.
In the case that no such goals are represented yet, you may represent a new goal by pressing the push button "Represent New Goal". This new goal can then be connected with the scenario.
Represent New Goal
Please try to follow the instructions in sequence, where the one highlighted through a white background is the current one.
1. Select the scenario instance "Starting A New Game".
2. Select the association "Achieves" in the right part of the window.
3. Expand its partition content by pressing its push button "+".
4. Create a tuple of this association by selecting "Instance Connection..." from the menu "Create".
5. Select in the pop-up window named "Create Instance Connection" those goals from the list to be connected with the scenario. Close this window by pressing the push button "Connect", which will connect the scenario with these goals.
Note, if no appropriate goal or no goal at all is displayed, then close this dialog window through pushing "Cancel".
Perform Instruction
Cancel



Guide -- Representing a Goal
Please try to follow the instructions in sequence, where the one highlighted through a white background is the current one.
Note: Whenever an instruction is followed successfully, the subsequent instruction is highlighted automatically. If you do not follow the current instruction, its text flashes. In the case that you need active support, please press the push button "Perform Instruction". The Guide will then perform this instruction on your behalf.
1. Select the class "Goals".
2. Create an instance of this class by selecting "Instance..." from the menu "Create".
3. Type an appropriate identifier for this goal in the pop-up window "Create Instance" and press the push button "Create".
4. Select the goal instance just created.
5. Select the attribute "Statement" in the right part of the window.
6. Expand its partition content by pressing its push button "+".
7. Switch to the edit mode for this attribute by selecting "Edit Text..." from the menu "Edit".
8. Enter a textual description for this goal (possibly in analogy to the ATM example goal given) and finish editing by pressing the push button "OK".

Examples

Supporting the Primary Tasks

- Presenting choice of conceptual entities to be modeled
- Providing example descriptions of conceptual entities
- Guidance in linking entities according to the method

Supporting the Secondary Tasks

- Active guidance through step-by-step instructions and monitoring
- Immediate feedback at each point
- Letting system perform actions on one ‘s behalf

Outline

- Background
- Functions / tasks, goals, scenarios / use cases
- Requirements and object-oriented models
- A systematic design process
- Scenarios / use cases for interaction design
- Summary and Conclusion

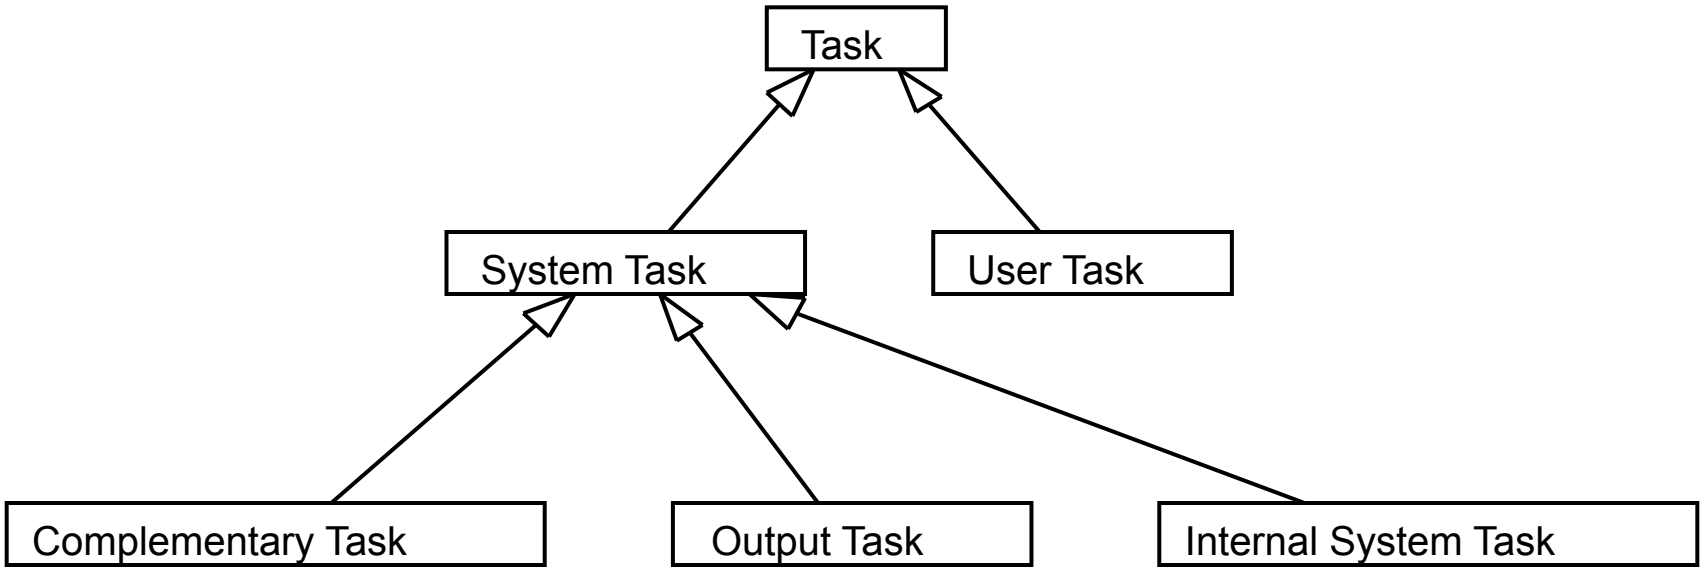
Interaction scenarios with attached task descriptions

- Scenarios as a prerequisite
- Example scenario: Get Cash from ATM
- Attached tasks:

  - Entering PIN code
  - Cash provision
  - ...
- Tasks of user and machine

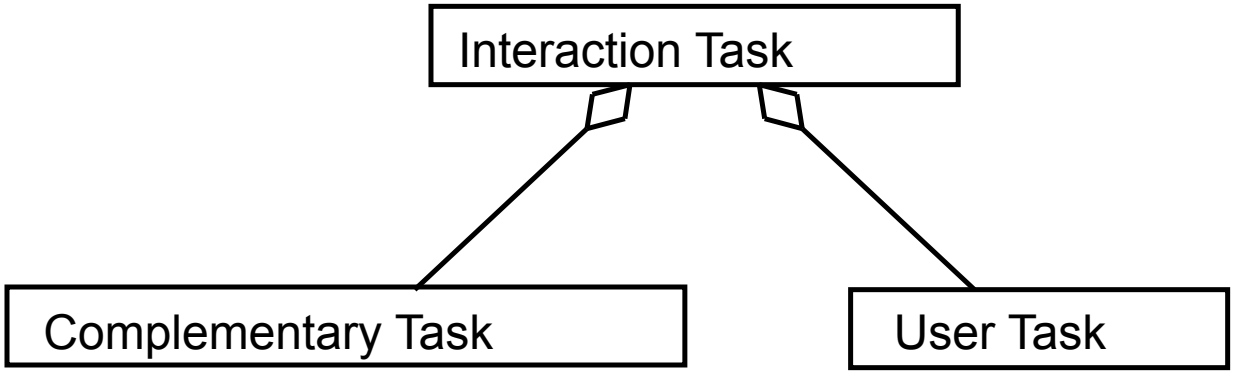
1. Put tasks into predefined categories

Based on a hierarchy of task categories



2. Aggregate complementary tasks

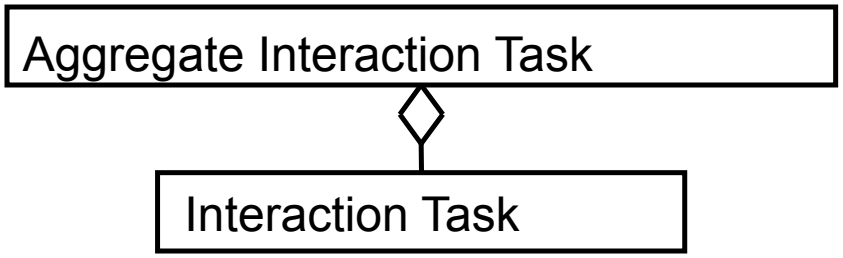
- Task of user and complementary task of machine
- Together make up an interaction through the UI



3. Compose and decompose tasks

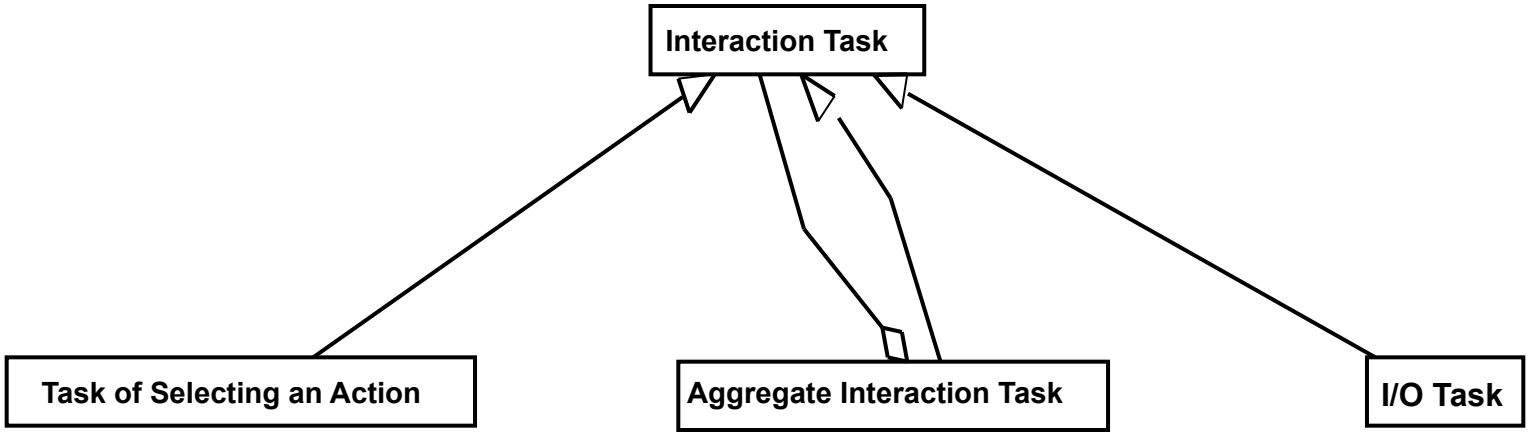
Find right granularity

- aggregate
- decompose



4. Classify tasks according to the kind of interaction

Based on defined hierarchy of Interaction Tasks



5. Map to widget classes

Task of selecting an action	⇒ Widget of selecting an action
Aggregate interaction task	⇒ Container
I/O Task	⇒ Control

Essential use cases

- Larry Constantine
- Essential modeling
- Abstract usage of system
- ATM example:

User	ATM
Identify self	
	Verify identity Offer choices
Choose	
	Dispense cash
Take cash	

Concrete vs. abstract – ATM Example

- John inserts his cash card with the magnetic stripe up into the slot of the ATM machine of the bank …
- The customer initiates a transaction by inserting a cash card.
- Insert card
- Identify self
- Request

There is a whole spectrum!

Concrete vs. abstract – Discussion

- Being concrete is one of the main points of scenarios, in contrast to abstract specifications!
- Scenarios may talk about more general uses through specific examples.
- How concrete is best (for which purpose)?
- Too much detail may contain built-in, premature assumptions (about a UI).
- Abstract descriptions leave choices open in the UI design.

Content model

- Larry Constantine
- Abstract interface contents
- Abstract components to be supplied by the user interface, placeholders for the actual visual components in the implemented interface

Video Titles

(list of titles)

Member Identification

Members

(list of members)

Process of content modeling

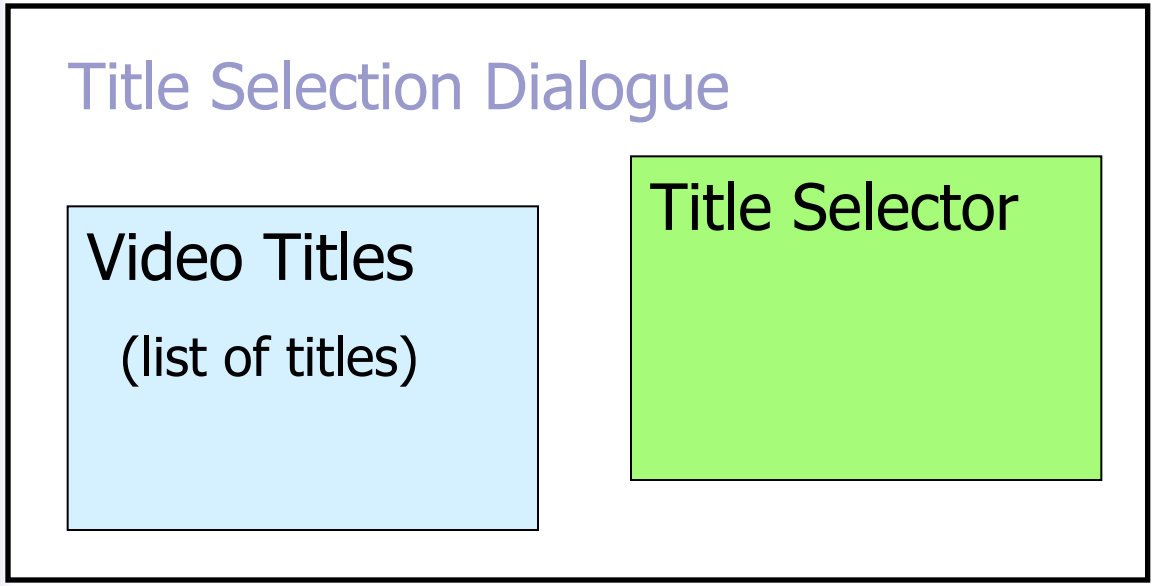
- Larry Constantine
- Examining (validated) use case narratives
- For each user step, what will have to be supplied for user to complete step?
- External view
- Language of user and application domain
- What information will be needed by and from the user?
- What functions will be needed by the user?

Essential use case – Video Store Example

User	Clerk	VSS
Identify self		
		Verify identity Offer video title choices
Choose video title for rent		
		Book rental Request hand-out of video copy
	Hand out copy	
…	…	…

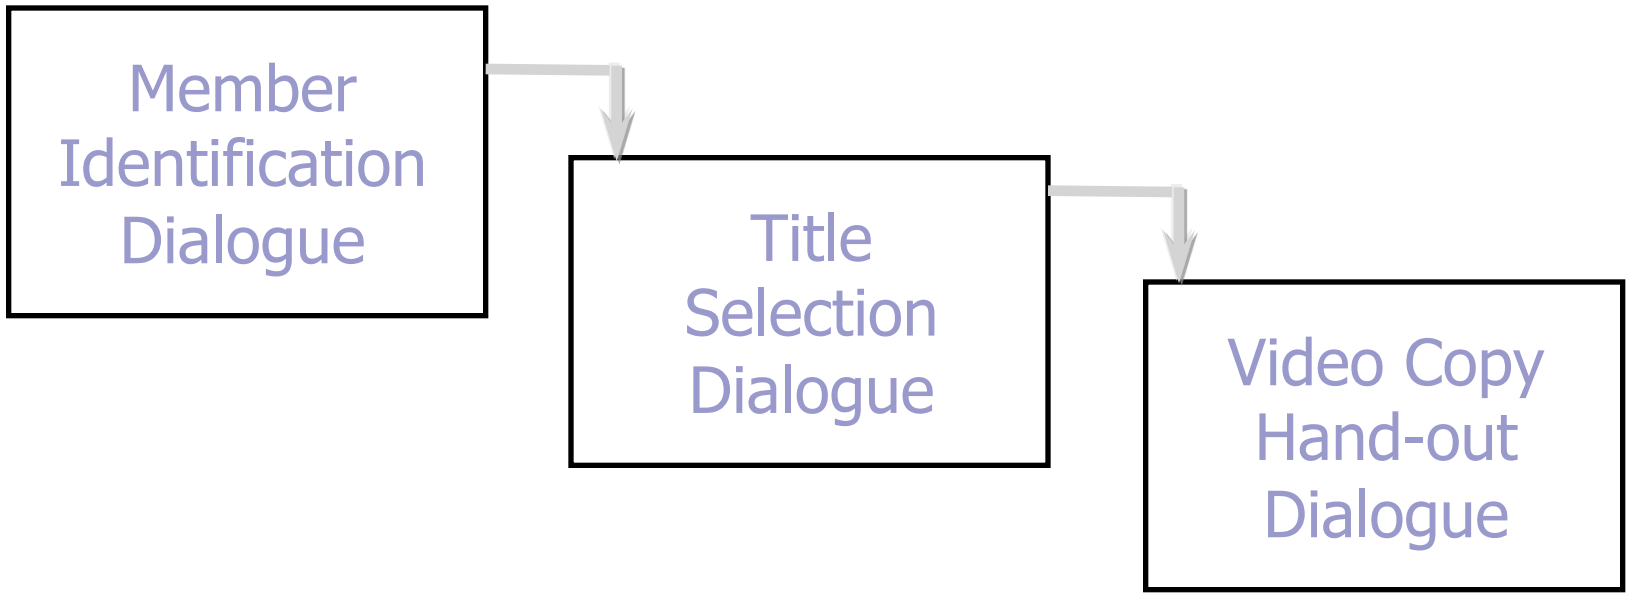
Interaction context

- Larry Constantine
- Different tasks carried out in different spaces / contexts
- Distinct interaction contexts in UI



Context navigation map

- Larry Constantine
- Navigational relationships among interaction contexts



Implementation model

- Larry Constantine
- Layout of the UI and interaction between user and system
- How to embody each abstract interaction context in the UI as an actual interaction context?
  E.g., as a screen, window, dialogue box, etc.
- How to realize each abstract component as some actual visual component on the UI?
  E.g., as a tool, command button, text box, etc.

Outline

- Background
- Functions / tasks, goals, scenarios / use cases
- Requirements and object-oriented models
- A systematic design process
- Scenarios / use cases for interaction design
- Summary and Conclusion

Summary and Conclusion

- Goals, scenarios and functions / tasks can be combined.
- This combination serves as a basis for a systematic approach.
- Scenarios / use cases may help both in requirements engineering and in interaction design.
- In this sense, scenario-based requirements engineering can facilitate interaction design.

What are requirements? – In practice

User requirements documents

Software/system requirements documents

Mostly descriptions in natural language

Representation often unstructured

Ad hoc process

Communication problem

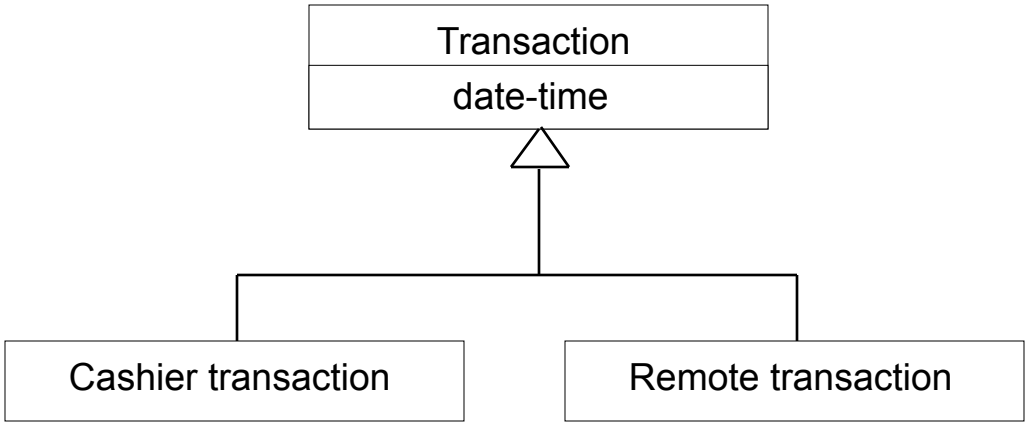
Requirements and use cases?

Class and generalization

Class in UML (Unified Modeling Language)
http://www.omg.org

Generalization /
Specialization
(in UML notation)

Object – instance



Inheritance

Example: attribute date-time

Mechanism for information sharing

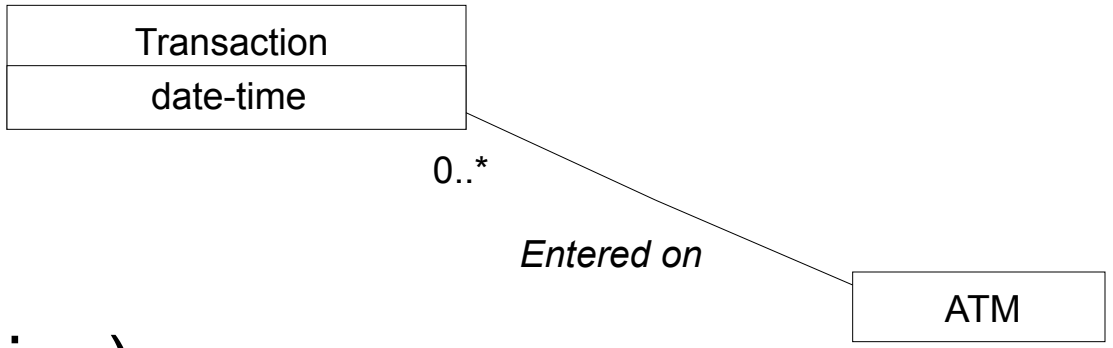
- Structure (variables, attributes)
- Behavior (methods, procedures)

Multiple inheritance

various theories

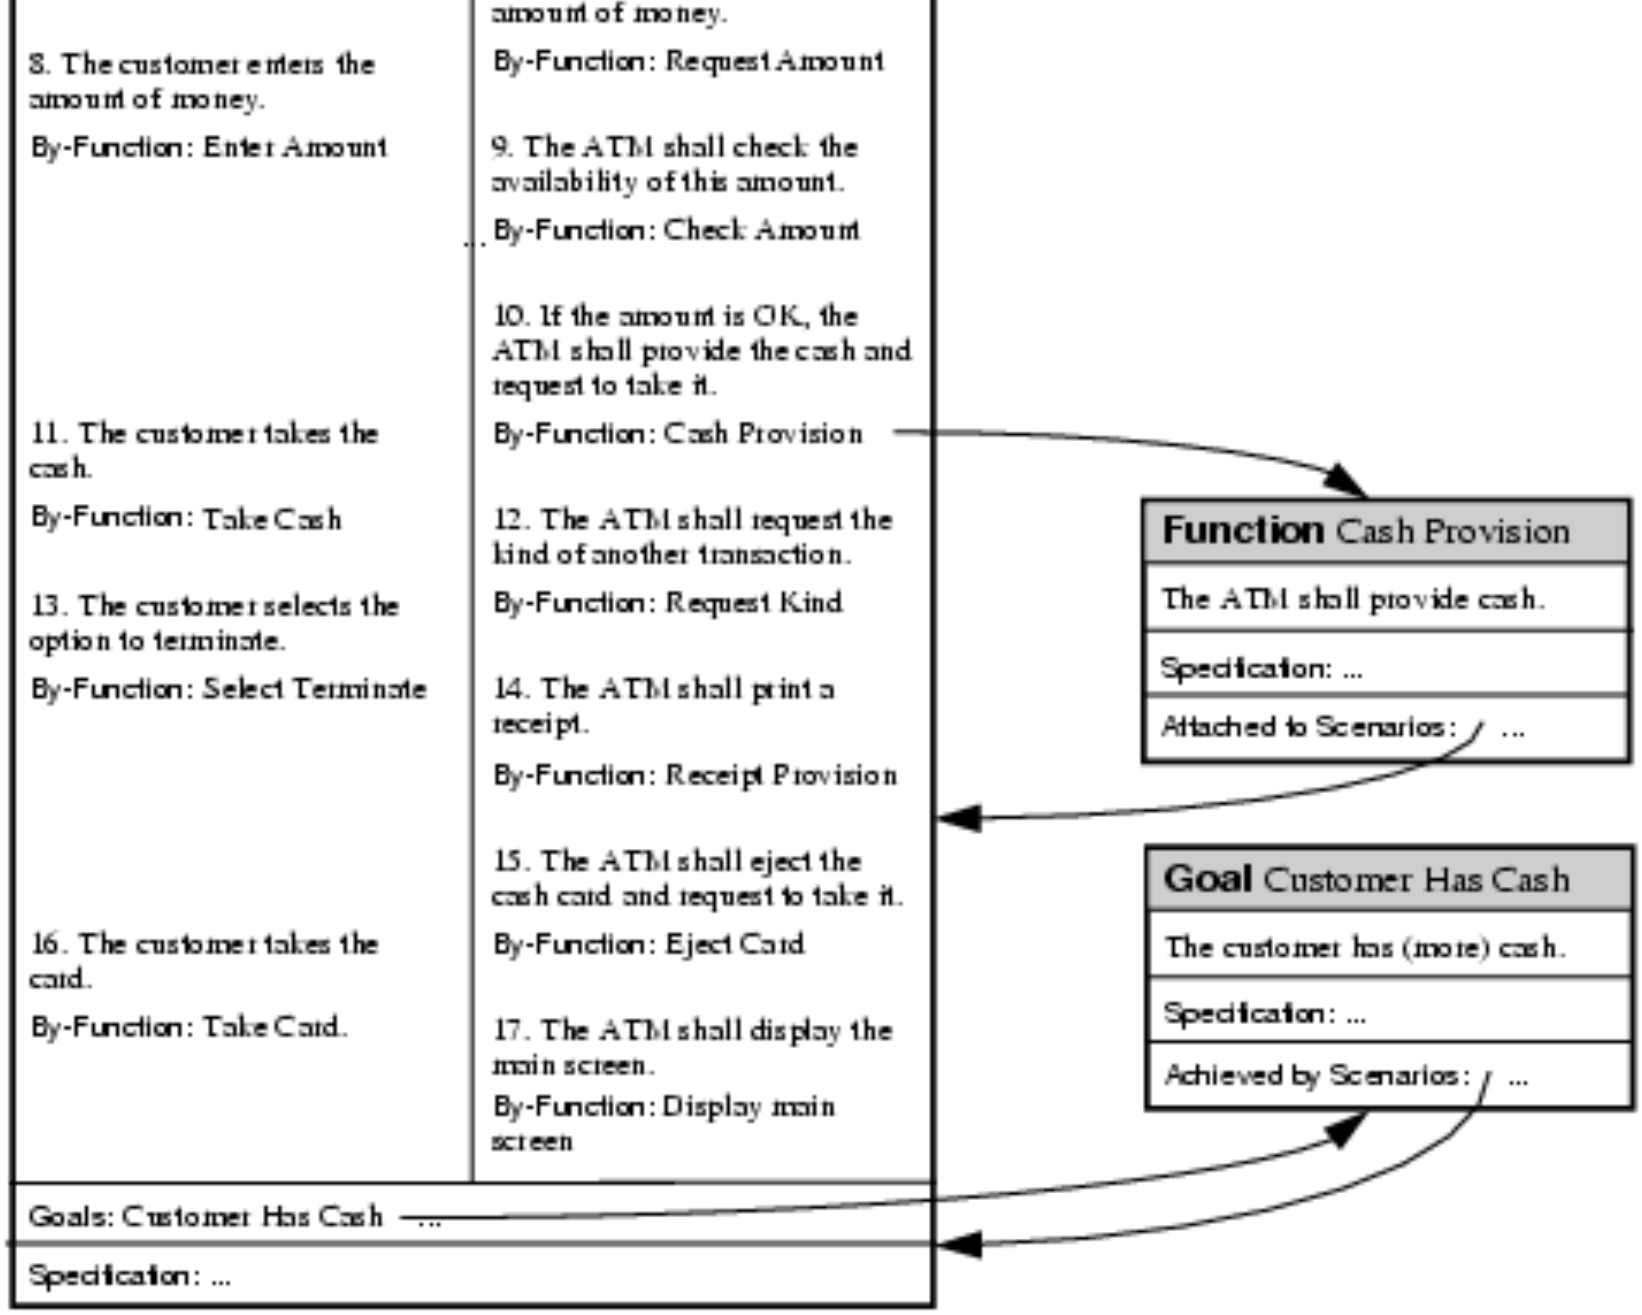
Attributes and associations

Attribute for representation of property



Association
(in UML notation)

Relation for linking instances
Multiplicity: range of allowable cardinalities



amount of money.
8. The customer enters the amount of money.
By-Function: Request Amount
By-Function: Enter Amount
9. The ATM shall check the availability of this amount.
By-Function: Check Amount
10. If the amount is OK, the ATM shall provide the cash and request to take it.
11. The customer takes the cash.
By-Function: Cash Provision
By-Function: Take Cash
12. The ATM shall request the kind of another transaction.
13. The customer selects the option to terminate.
By-Function: Request Kind
By-Function: Select Terminate
14. The ATM shall print a receipt.
By-Function: Receipt Provision
15. The ATM shall eject the cash card and request to take it.
16. The customer takes the card.
By-Function: Eject Card
By-Function: Take Card.
17. The ATM shall display the main screen.
By-Function: Display main screen
Goals: Customer Has Cash ...
Specification: ...
Function Cash Provision
The ATM shall provide cash.
Specification: ...
Attached to Scenarios: ...
Goal Customer Has Cash
The customer has (more) cash.
Specification: ...
Achieved by Scenarios: ...

Soft-Goals and Quality Requirements

- Quality requirements may be very difficult to state precisely.
- Imprecisely stated requirements may be difficult to verify.
- Soft-goal
  A general intention (such as ease of use); normally achievable to a certain degree only.
- Verifiable quality requirement
  A statement using some measure that can be objectively tested.

Soft-Goals and Quality Requirements – Examples

- A Soft-Goal
  VSS should be easy to use even by inexperienced users.
- Verifiable quality requirements
  - After a total of two hours training, clerks shall be able to use all the VSS functions.
  - After a total of two hours training, the average number of errors made by clerks shall not exceed five per day.

Types of requ. – Which "system"?

- Requirements for proposed system to be built
  Software (and hardware) system
- Requirements for composite system
  Including human users and business artifacts
