

# Model Integration Extracting Value from MBSE

Henry Broodney, Uri Shani, Aviad Sela

IBM Research  
Haifa, Israel

# Agenda

- Information integration overview
  - Definitions - Use cases and workflows
  - State-of-the-art
- Creating and leveraging linked data – from chaos to order
- Beyond linked data – model based development leveraging ontologies
- Getting the right data to the right place the right way
  - analytics integration platform
- Summary

# Use cases of data integration

- Engineering data management: Interlink elements from various sources
  - Traceability
  - Impact analysis
  - Management
  - Process compliance
  - .....
- Co-development: Reuse data and models between tools and developers
  - Synergy and synchronization in development
  - Earlier discovery of issues
  - Less error prone document based processes
  - .....
- Analytics data integration: Facilitate seamless data flow to the analytics engines
  - Streamline analytics processes
  - Minimize analytics setup overheads
  - Guarantee data integrity, validity and currency
  - .....

# Current Situation

- Trends
  - Engineering processes use more and more data
    - Trial data
    - Usage (lifecycle) data
  - Users want traceability, transparency, flexibility
    - Wider adoption of OSLC
    - Exploration into ontologies and semantic web
  - Information alignment and synchronization is key to efficiency
- State-of-the-art
  - Point to point integrations per tool per domain
  - Multi-point integrations (RELM) emerged, but the end points are still manually aligned
  - Any engineering analysis requires lengthy stage of input preparation and its subsequent management (change, versioning, etc.)

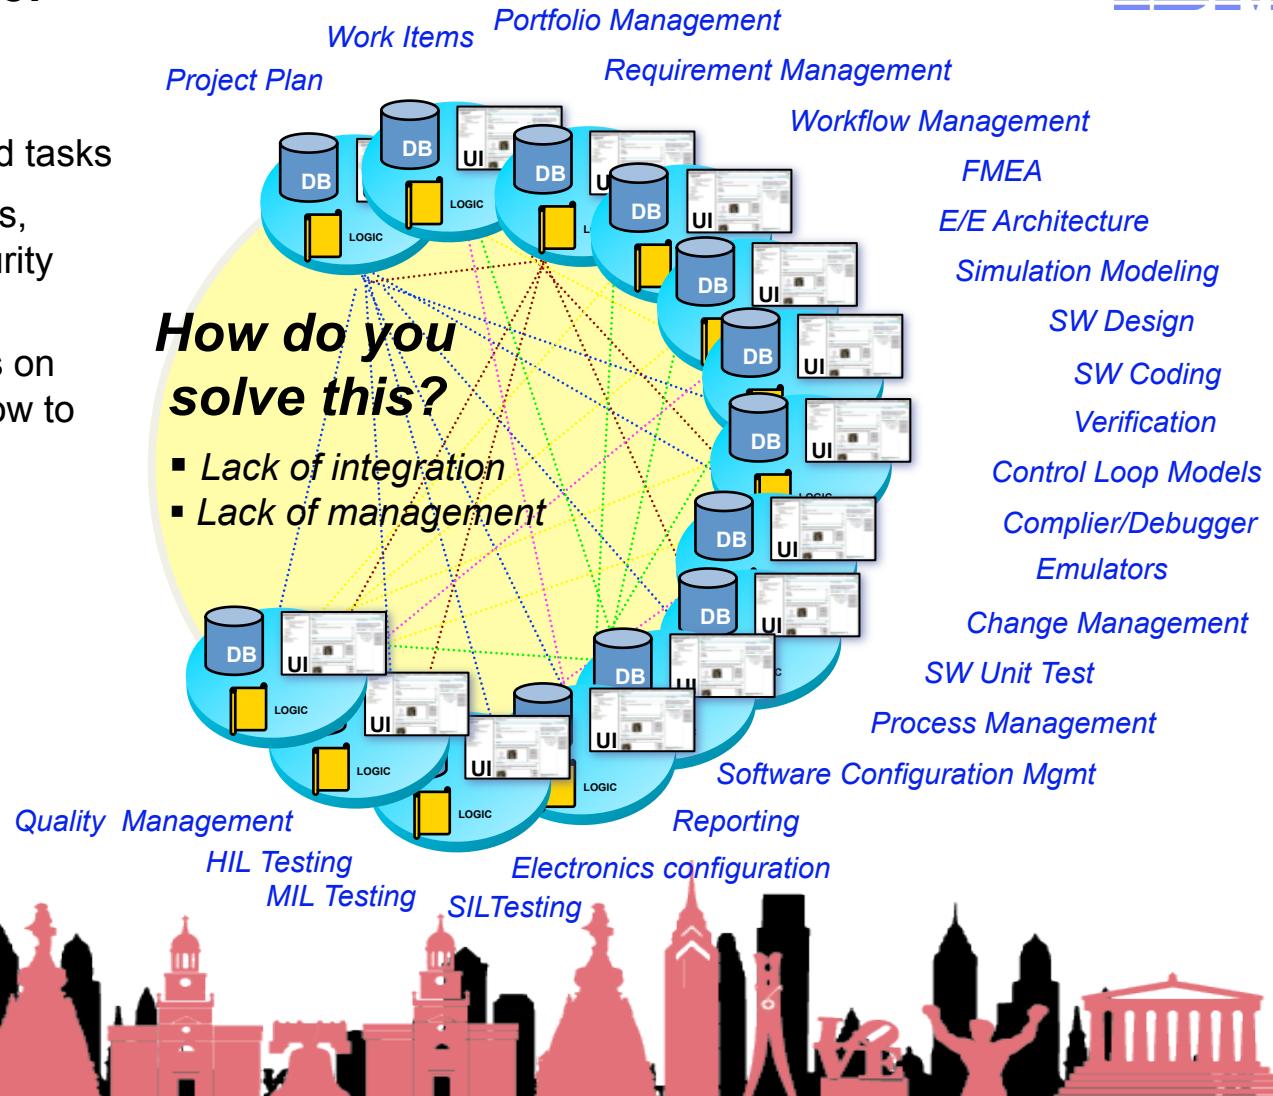

# From Chaos to Order

# Fragmented Environments

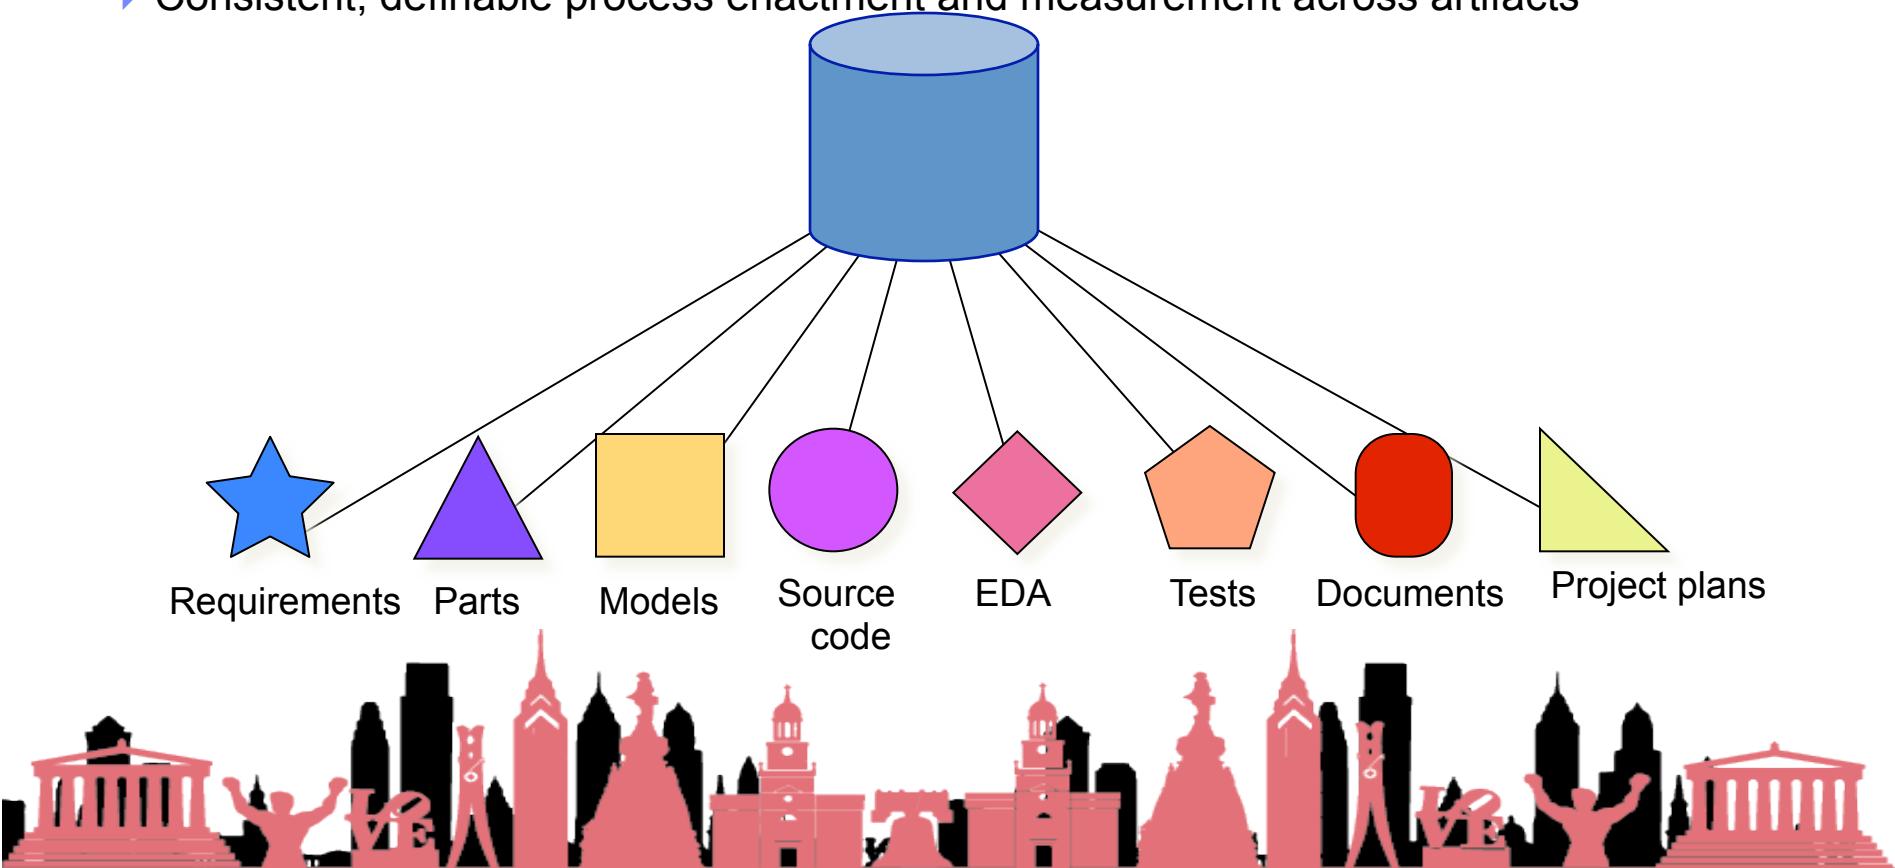

- Traditionally, each tool came with its own
  - **UI** – Web and desktop presentations of views and tasks
  - **Logic** – Workflow, process, search, query, scale, security and collaboration
  - **Storage** – Individual files on workstation or servers: How to ensure availability and traceability?
- Resulting in...
  - Brittle/poor integrations
  - Silos everywhere
  - High cost to maintain and administer
  - Low re-use

# Desired end-user view: A common repository

## Desired traits

- **Common repository for all engineering data –**  
a “single source of truth”
  - ▶ Easy traceability and query across artifacts
  - ▶ Consistent, definable process enactment and measurement across artifacts

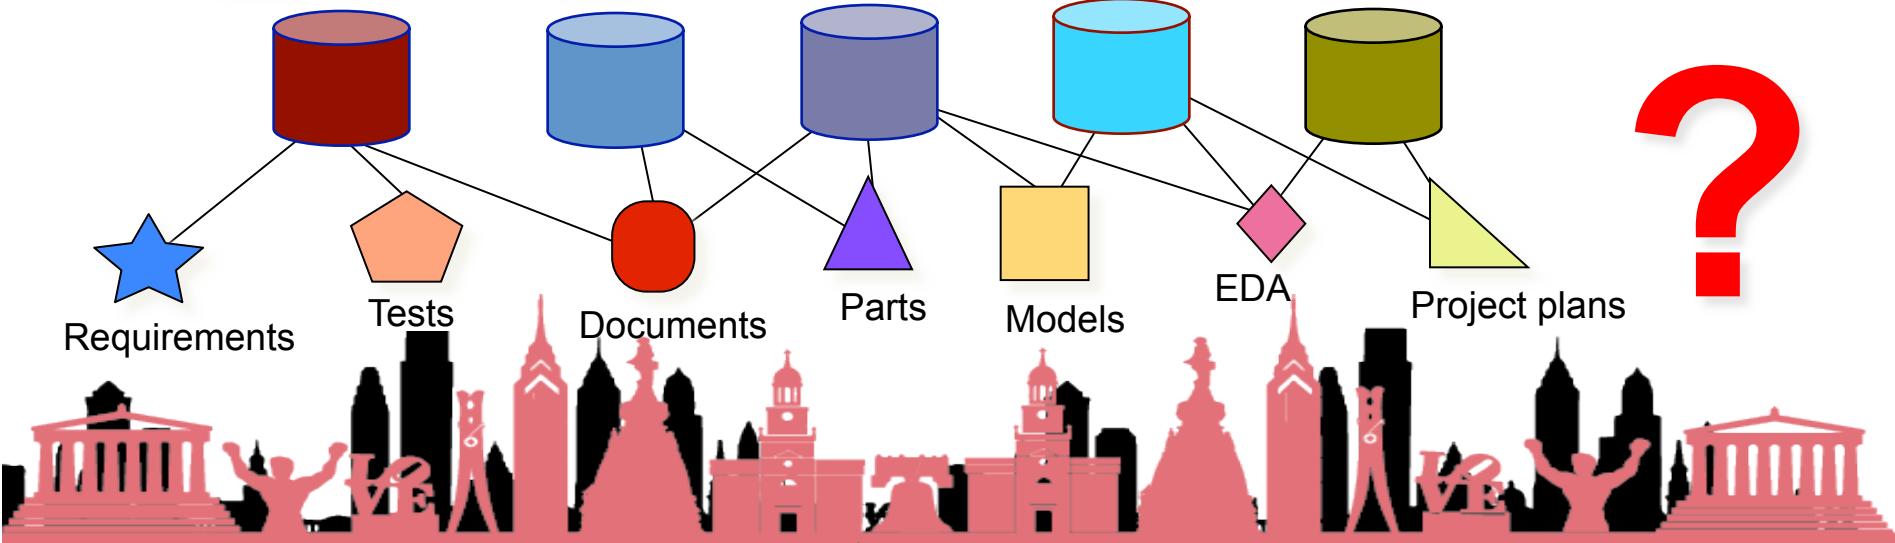

# Desired end-user view not practical

## Desired traits

- **Common repository for all engineering data**  
a “single source of truth”
  - ▶ Easy traceability and query across artifacts
  - ▶ Consistent, reliable process enactment and measurement across artifacts

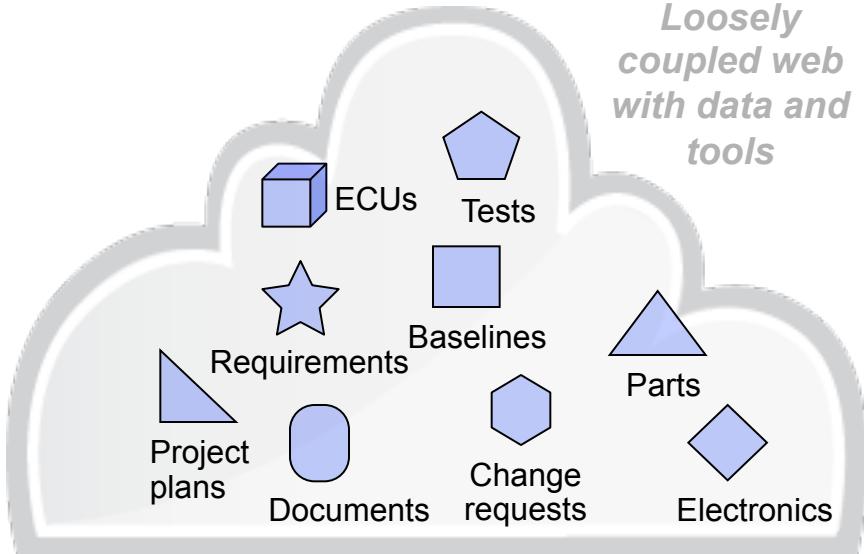

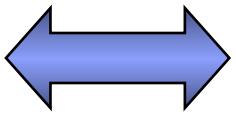

## Issues

- **Not practical** to move all applications to a common repository
- Common, consistent schema for all apps requires big tradeoffs (performance, size, upgrade, backup, etc.)
- Must have a strategy to deal with integrating heterogeneous data sources

# An open platform for a loosely coupled “web” of engineering data

Single point of truth  $\neq$  Single repository

Aggregate data from many sources into custom web UI mashup for each role

User sees data and operations, not products

Federated integration architecture  
Enables easy upgrade

Provides common, cross-product capabilities (search, query, report, process, etc.)

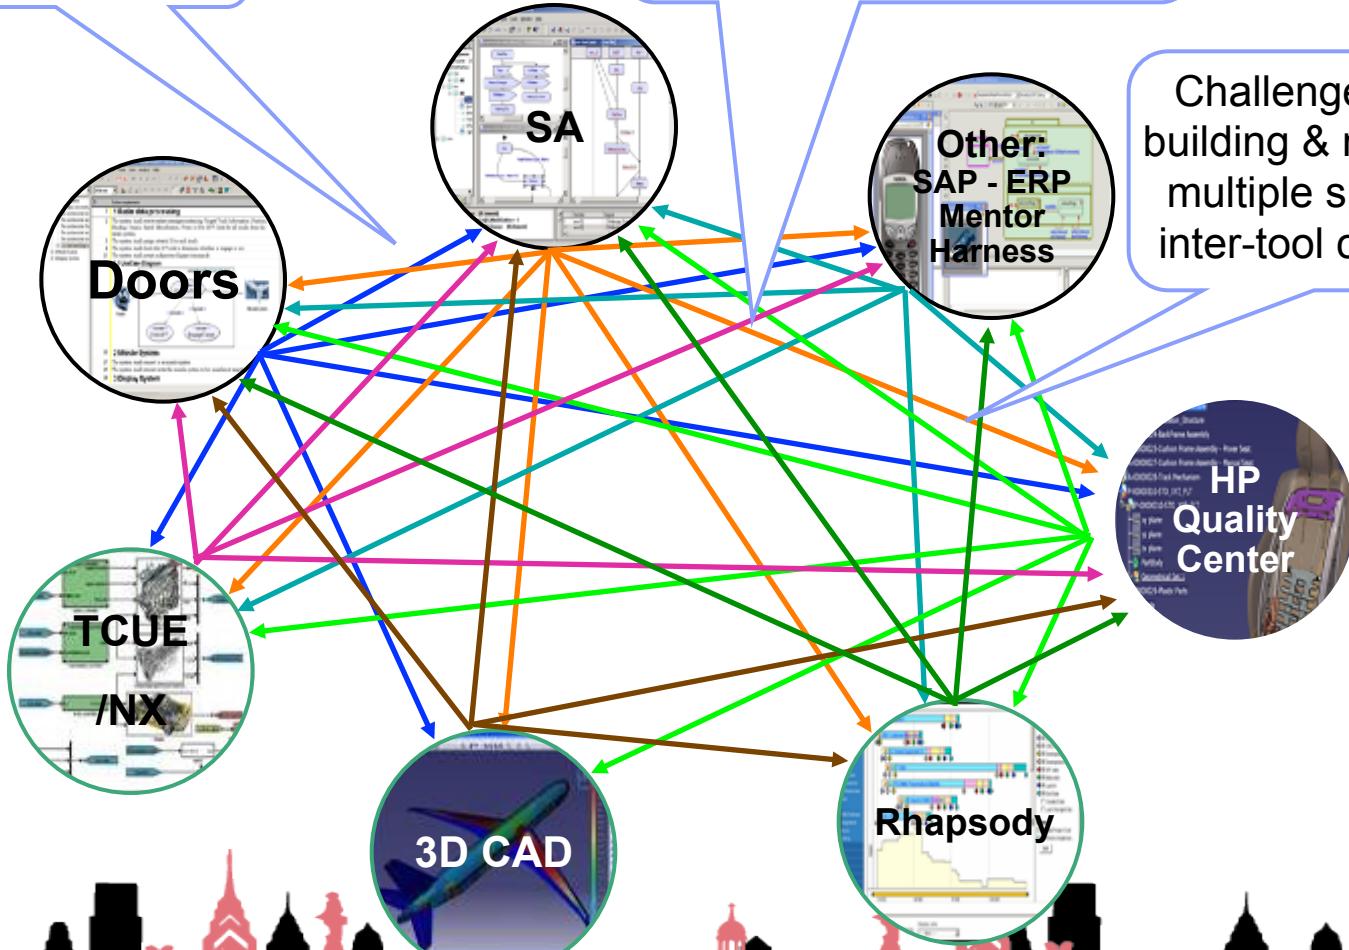

# Data Continuity Challenges

Challenge 3: Extend to additional tools

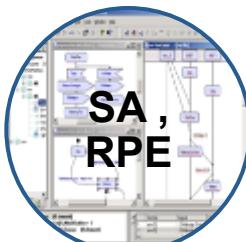

Challenge 2: Avoid inter-tool data duplication , while maintaining traceability

Challenge 1: Avoid building & maintaining multiple specialized inter-tool connectors

# The Solution Approach

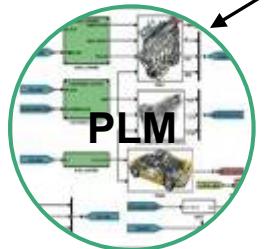

✓ Product data exists in different systems

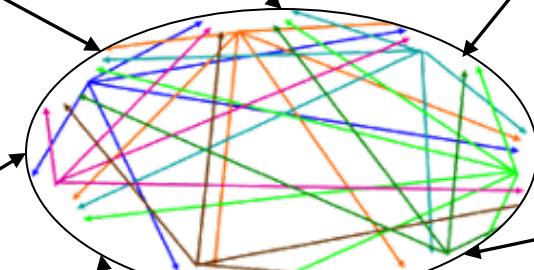

✓ Traceability

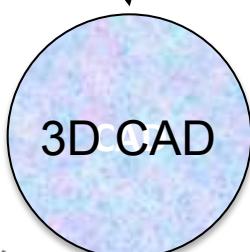

✓ No peer to peer integration

✓ Data Continuity

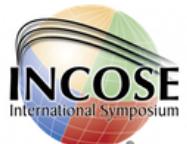

✓ Impact analysis

✓ Data Duplication

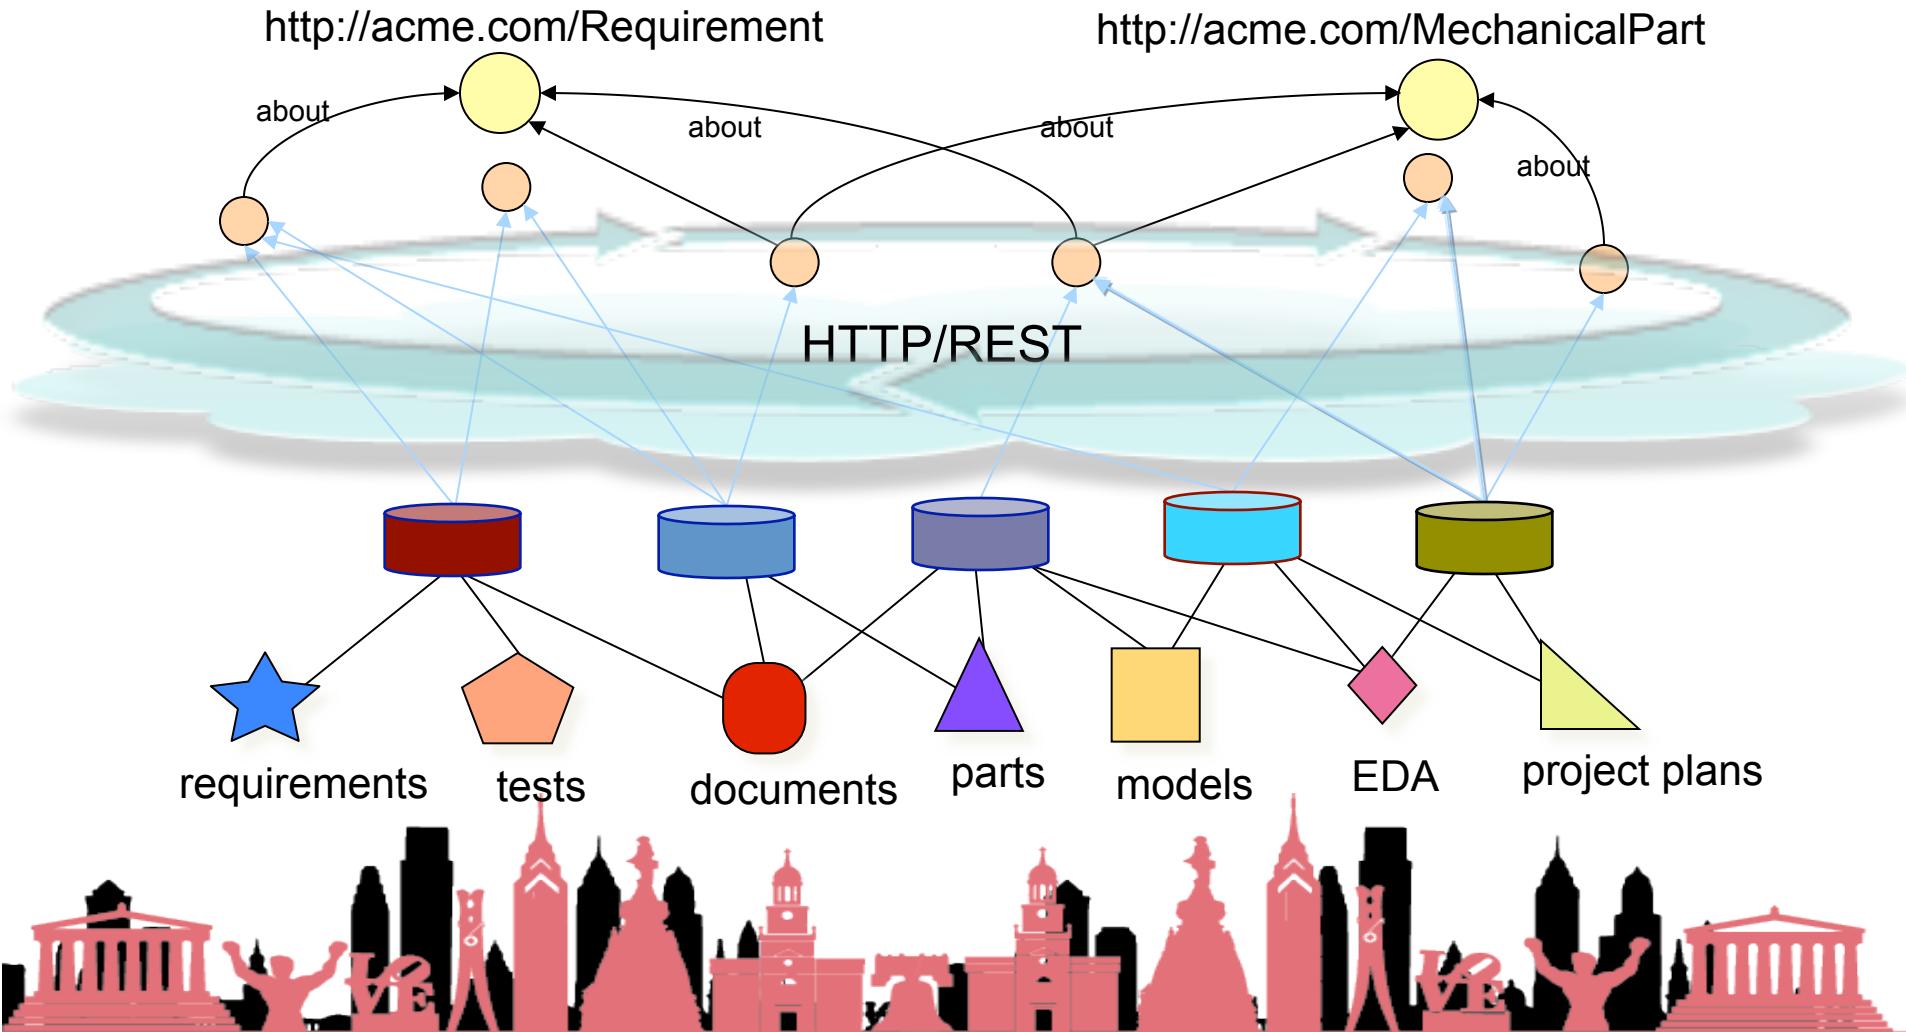

# Smarter development using an Internet inspired architecture

Philadelphia, PA  
June 24-27, 2013

The Web has proven to be the most scalable, open, and flexible integration technology

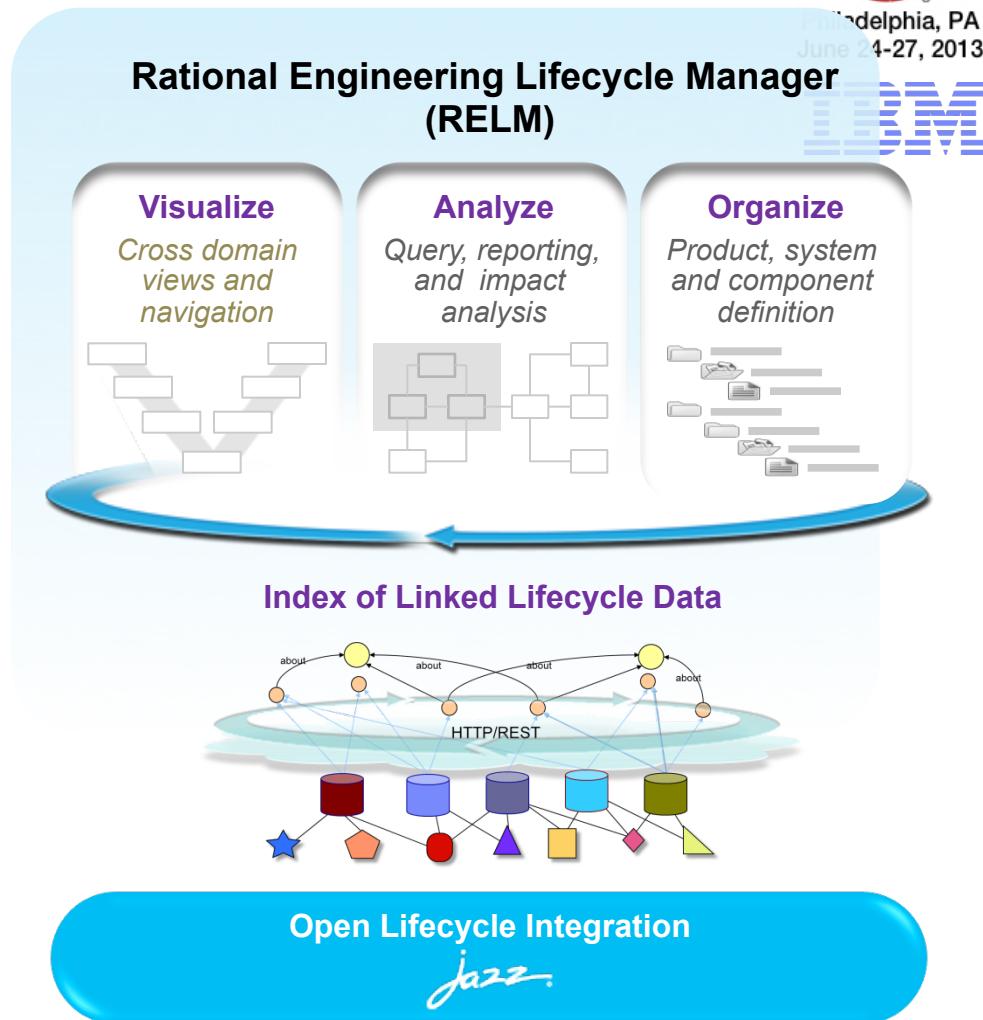

# Rational Engineering Lifecycle Manager

Philadelphia, PA  
June 24-27, 2013

- Uses a Linked Data approach that enables
  - ✓ *Visibility* – across many sources of data
  - ✓ *Organization* – information in context
  - ✓ Analysis - answer questions using that contextualized information
- Allows stakeholders to:
  - manage growing complexity
  - derive knowledge from the available data
  - make timely and correct engineering and business decisions

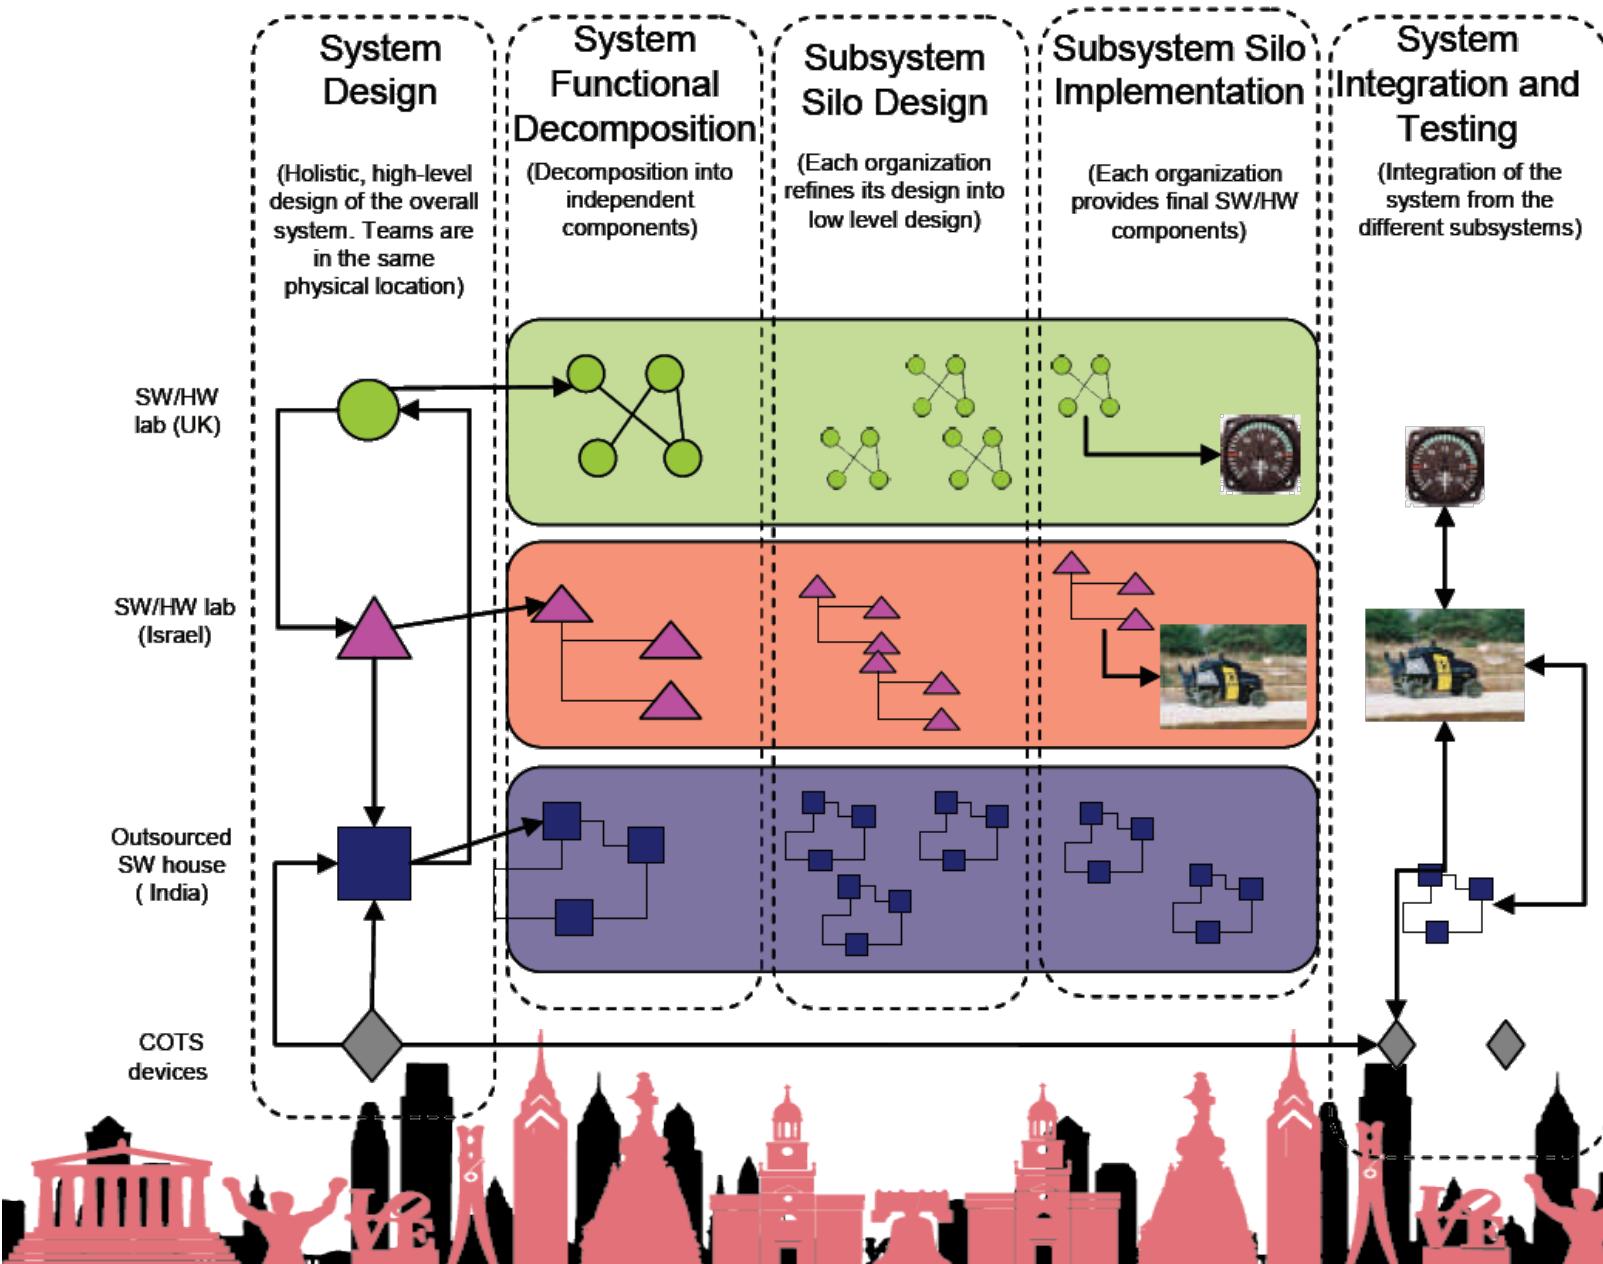

# Beyond Linked Data

## Co-development

# Starting Point – Today Approach

# Desired Goal – Next Generation

## System Design

(Holistic, high level design of the overall system. Teams are in same physical location)

## System Functional Decomposition

(The system is broken into independent components )

## Networked Subsystem

### Design

(The virtual networked organization refine its design with seamless connectivity between design artifacts)

## Networked Subsystem Implementation

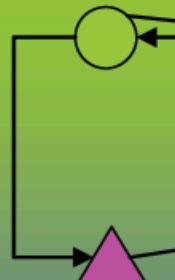

(Co-developing the SW/HW subsystems with seamless connectivity to the physical devices)

## Networked System Integration and Testing

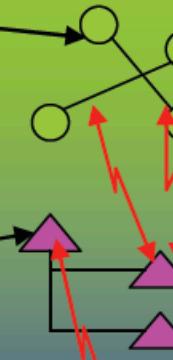

(continue and iterative integration of the system from the different subsystems)

### *The Internet of Systems Engineering* Network of Designers, Design Models and Physical Devices

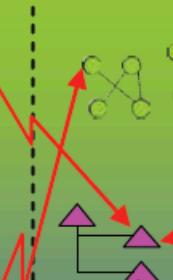

SW/HW lab (UK)

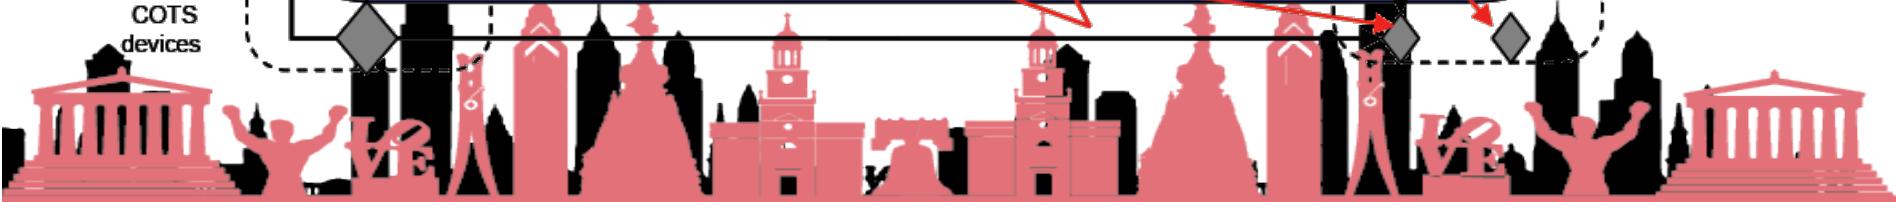

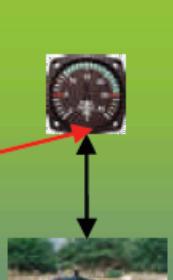

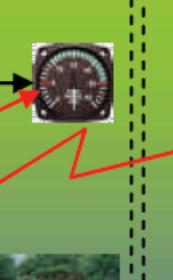

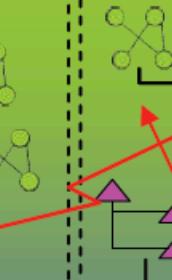

SW/HW lab (Israel)

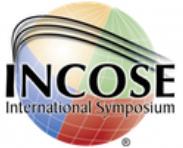

Outsourced SW house (India)

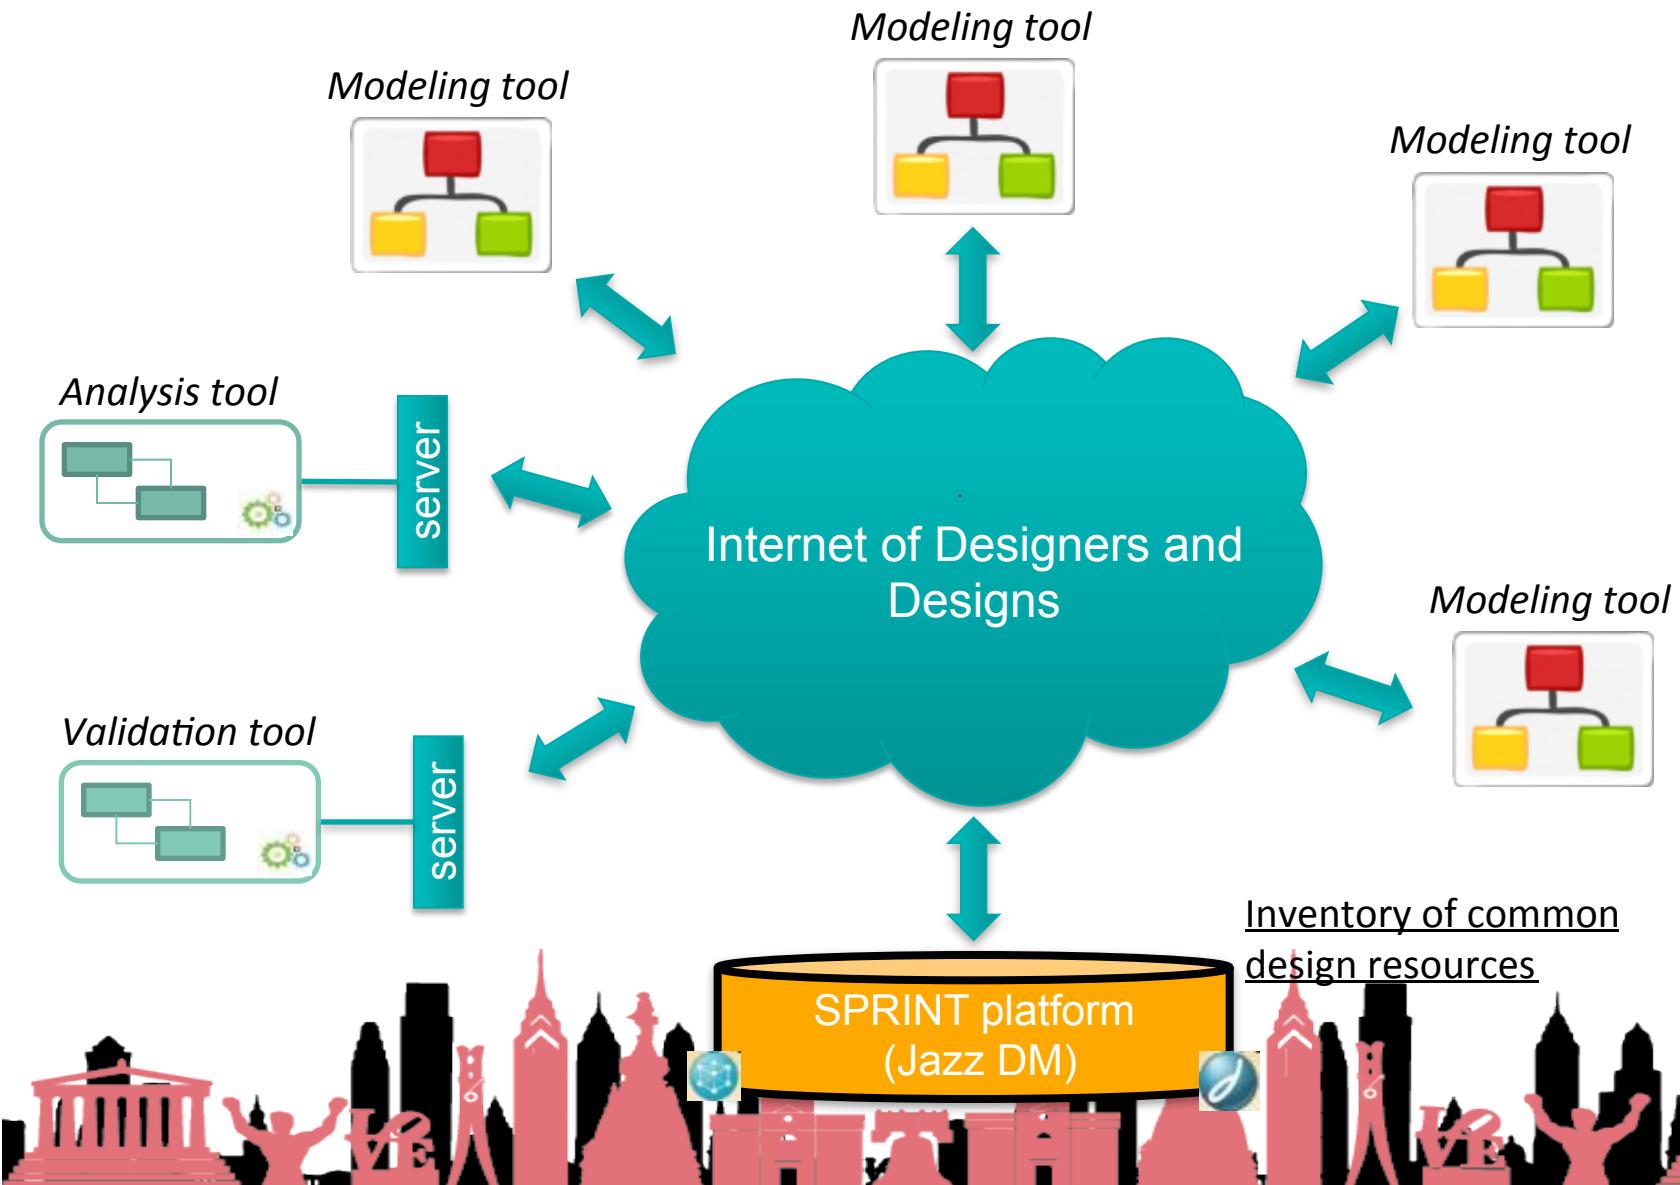

COTS devices

# Rhapsody

## Simulink

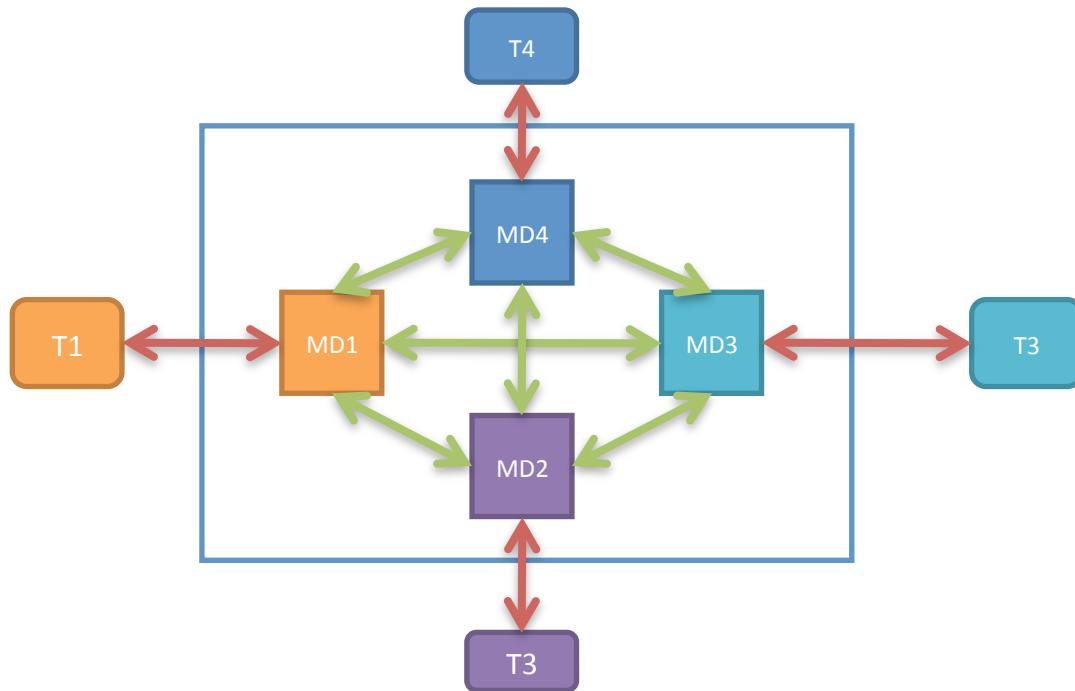

# Internet of Systems Engineering

# IoSE Story in a Nutshell

# Point-to-point semantic mediations

- Each tool imports/exports models on its own meta-data
- Semantic mediation relations established between each pair of meta-data
  - ➔ To cover all transformations, we need  $(N^*(N-1)) / 2$  relations

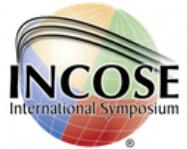

# Common Meta Model

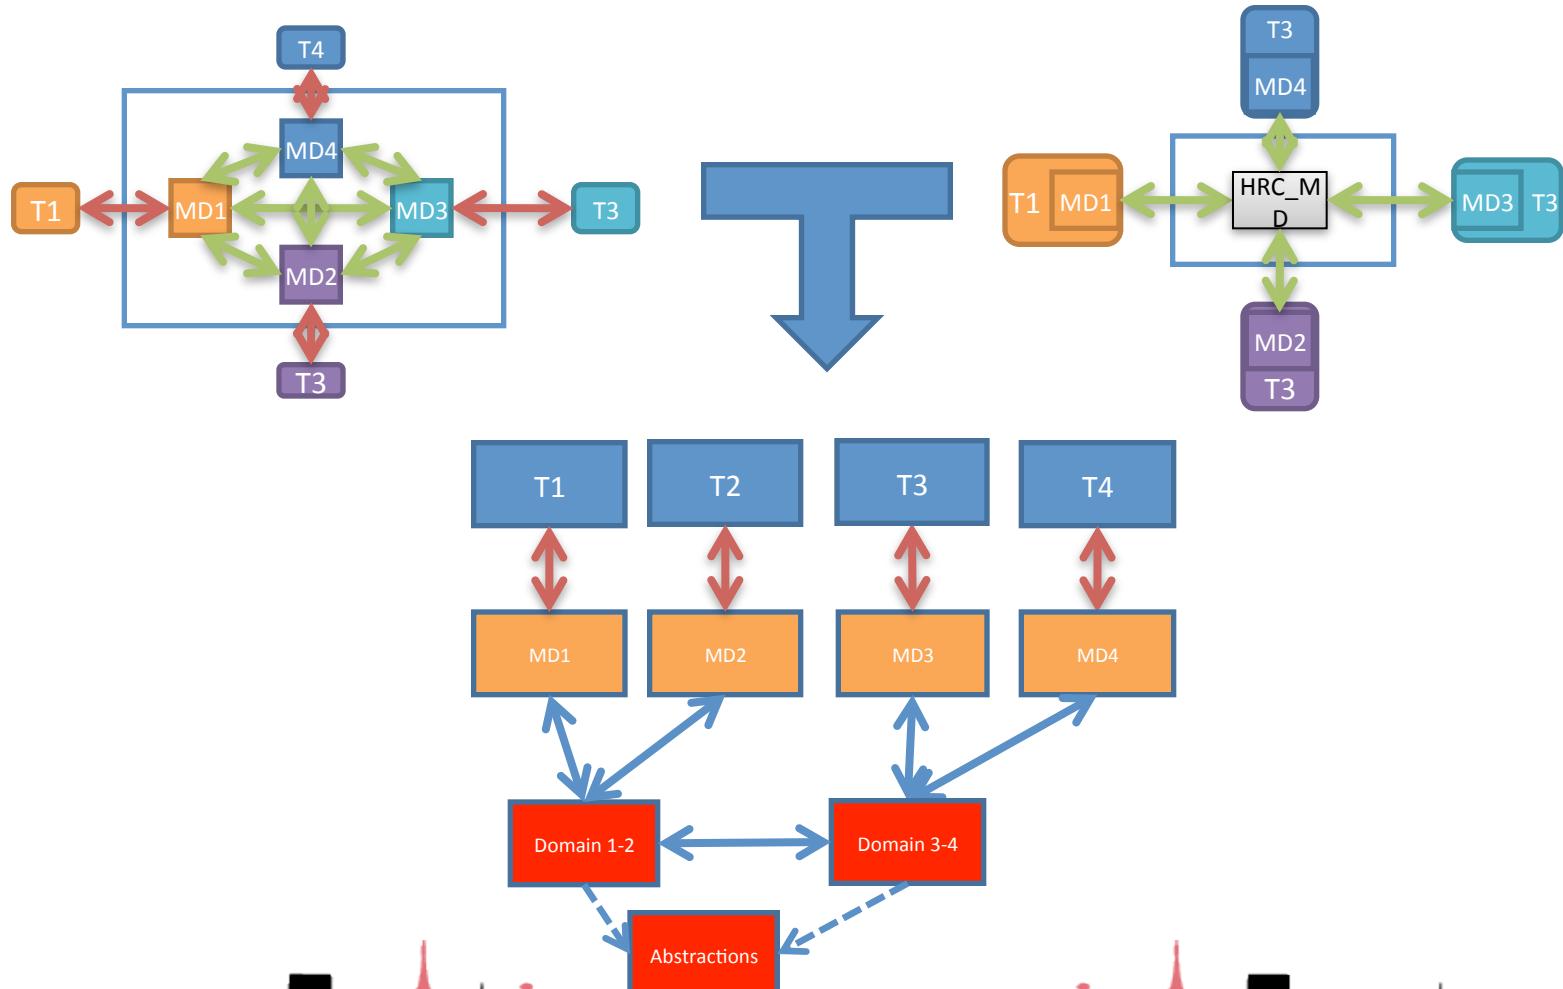

- Each tool imports/exports models on the universal, commonly agreed meta-data
- Semantic mediation is guaranteed by the usage of the unique meta-data for the exchange of models

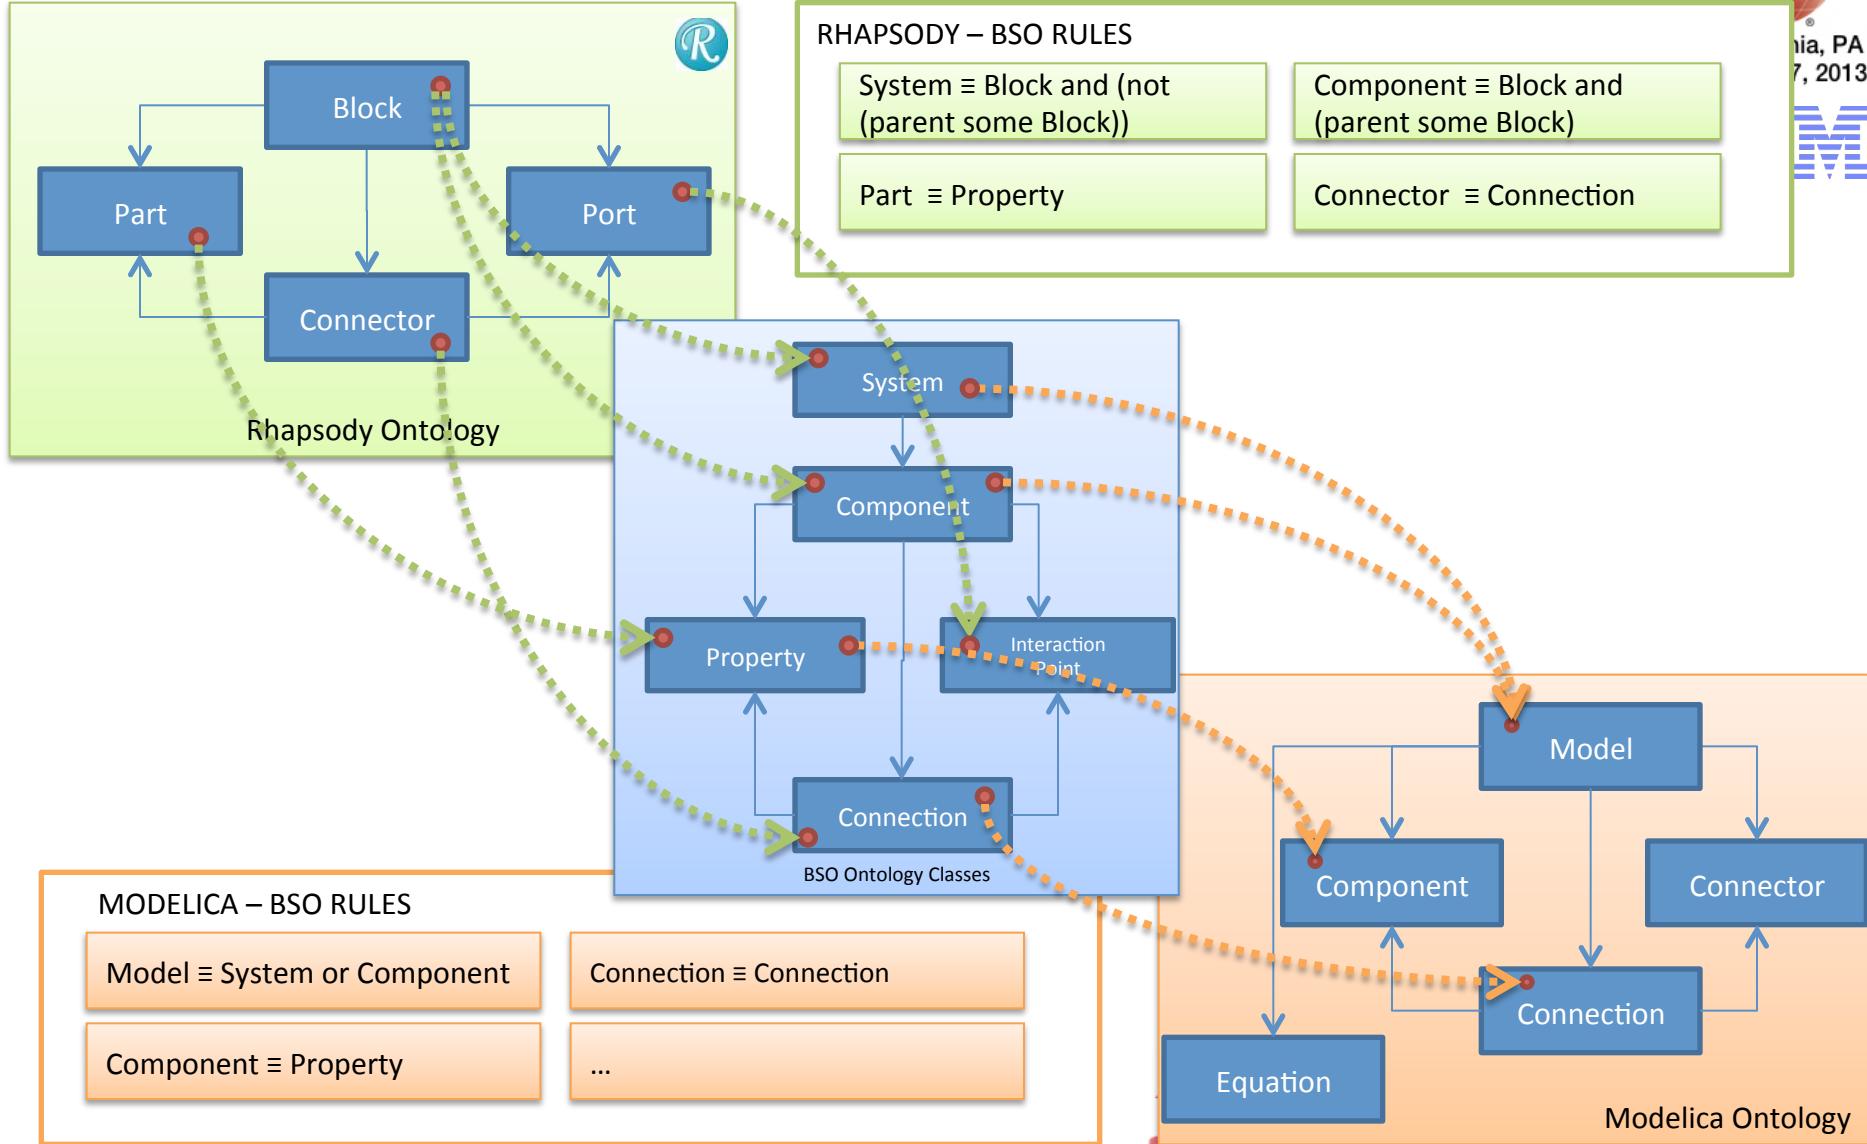

# Evolution of the Semantic Mediation Idea

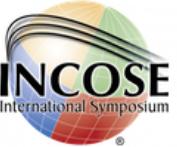

Philadelphia, PA  
June 24-27, 2013

# Semantic mediation in action

# Semantic Mediation Framework Architecture

Philadelphia, PA  
June 24-27, 2013

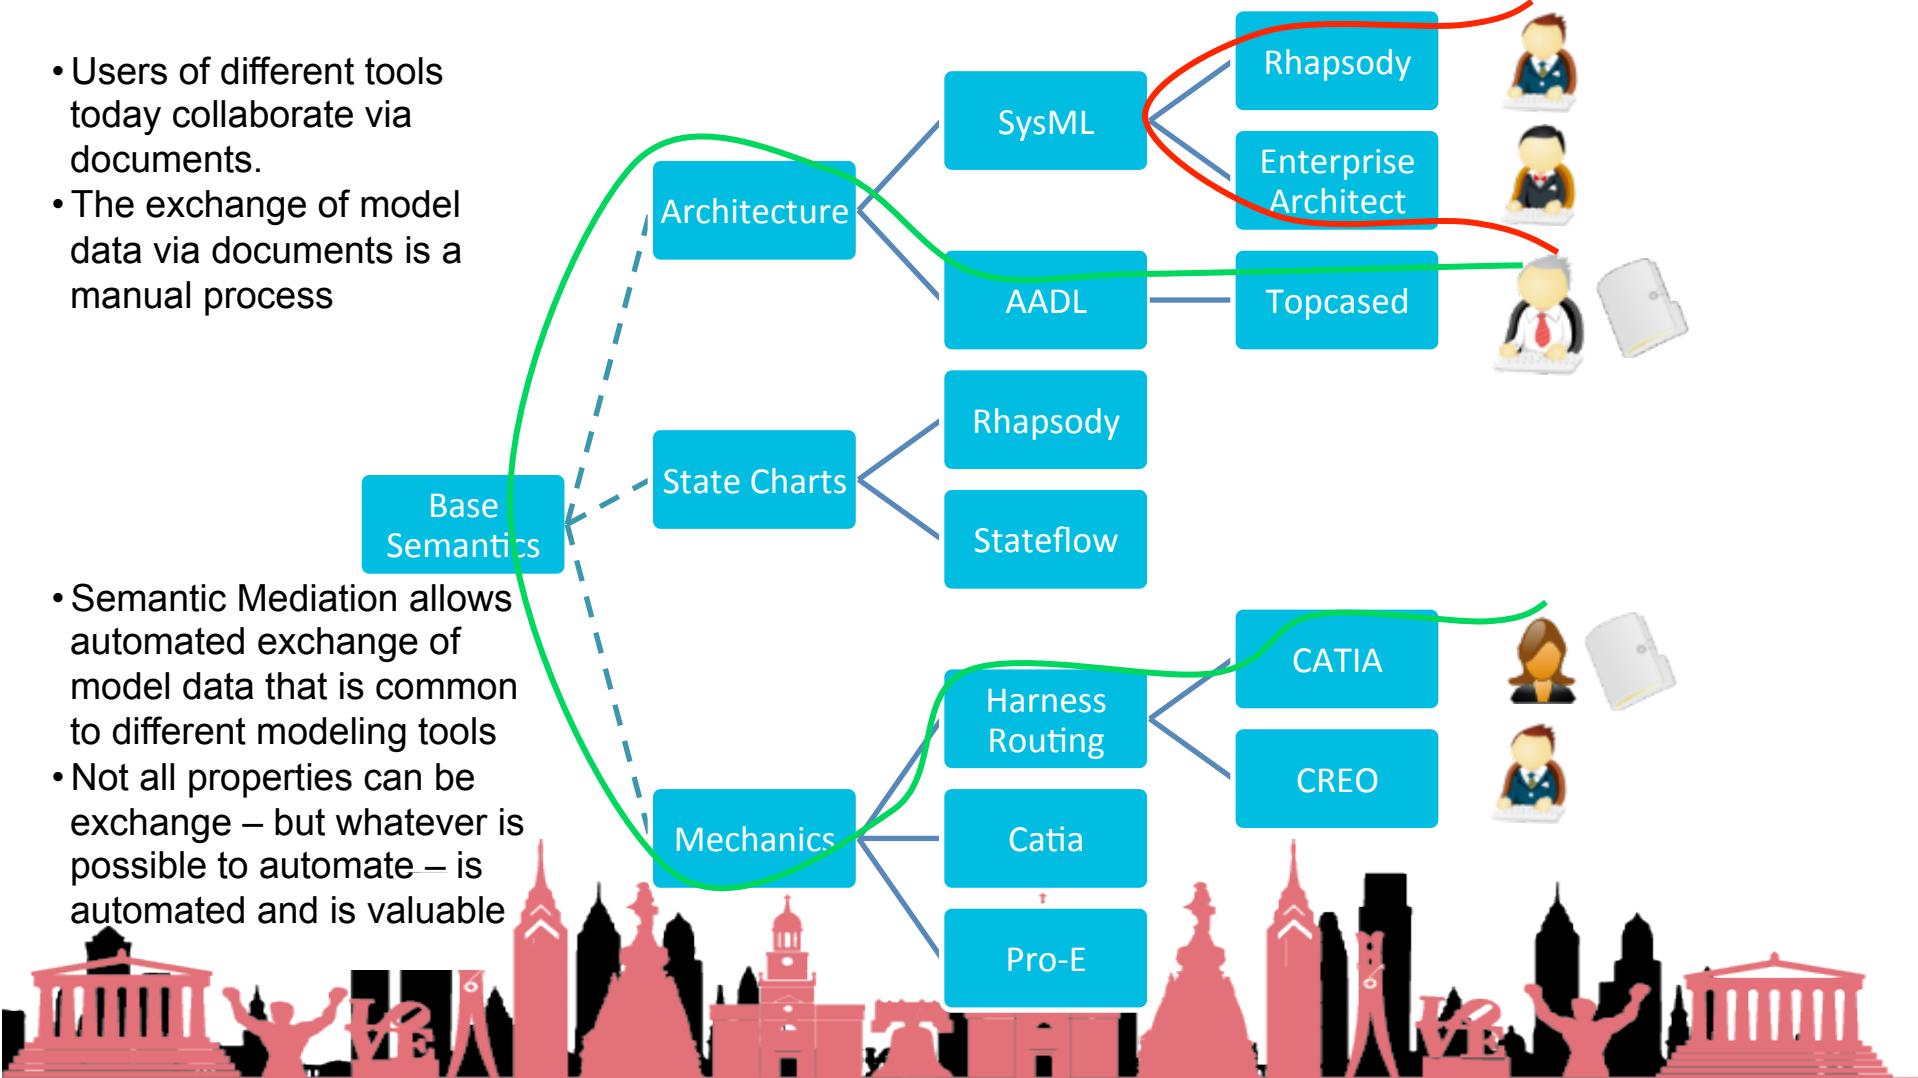

*Abstraction*

*Enrichment*

- Users of different tools today collaborate via documents.
- The exchange of model data via documents is a manual process

- Semantic Mediation allows automated exchange of model data that is common to different modeling tools
- Not all properties can be exchanged – but whatever is possible to automate – is automated and is valuable

# Analytics Integration Platform

# Who needs the data?

Philadelphia, PA  
June 24-27, 2013

Optimization

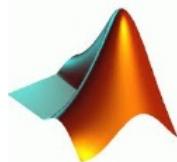

modeFRONTIER
