# A Business Process view of Software:

*An effective measurement model to assess the operations readiness of software under construction*

**Ramesh Kumar Ramakrishnan**

**TATA Consultancy Services, INDIA**

# Context

- Delays are common in large Software development projects
- Delays can result in –
  - Loss of market share
  - Loss of reputation
  - Reduced motivation / morale of employees
  - Increased costs (project & maintenance)
- Brooks' law is a claim about software project management according to which *"adding manpower to a late software project makes it later."*

# Problem Scenario

- What options are available to the Business, when a delay is imminent on a time-to-market sensitive project?

1. Provide more schedule time to complete the project (and compromise on the envisaged Time-to-Market advantages)

2. Roll out the software into production with manageable impact to project objectives (due to Delay-to-Market)

# Challenge

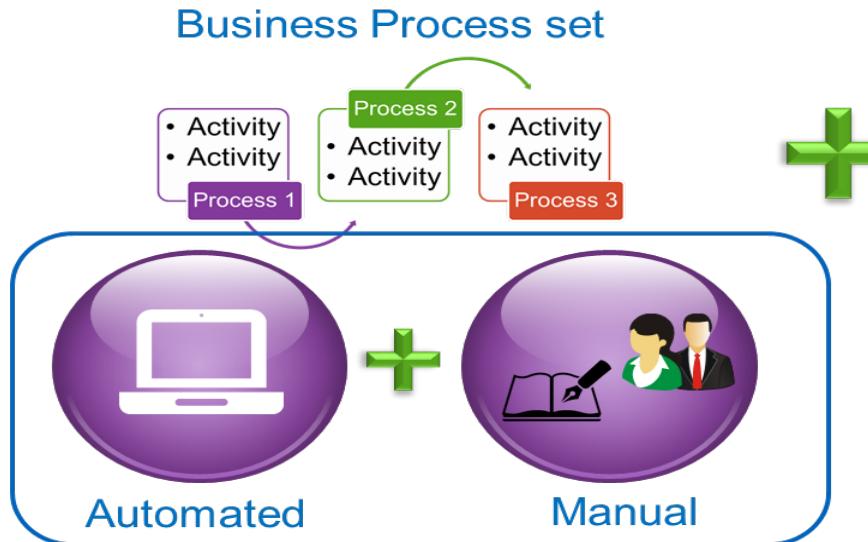

- At a **juncture where there is delay** in the project and the business has to go ahead with the rollout decision, the business needs a good understanding of -
  1. The impact of the delay on the business objectives related to the project (Business usually has the means to understand this).
  2. **Operational readiness of the Software** that is being developed. Ie; the ability to use the software in operations and deliver on the objectives

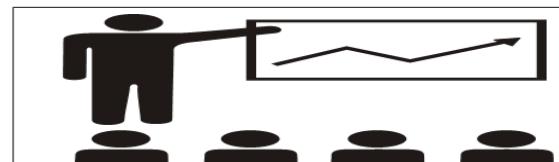

Quantifying and representing the readiness in operations terms is the challenge

# Challenge....contd;

*Business operations can be understood in simple terms as*

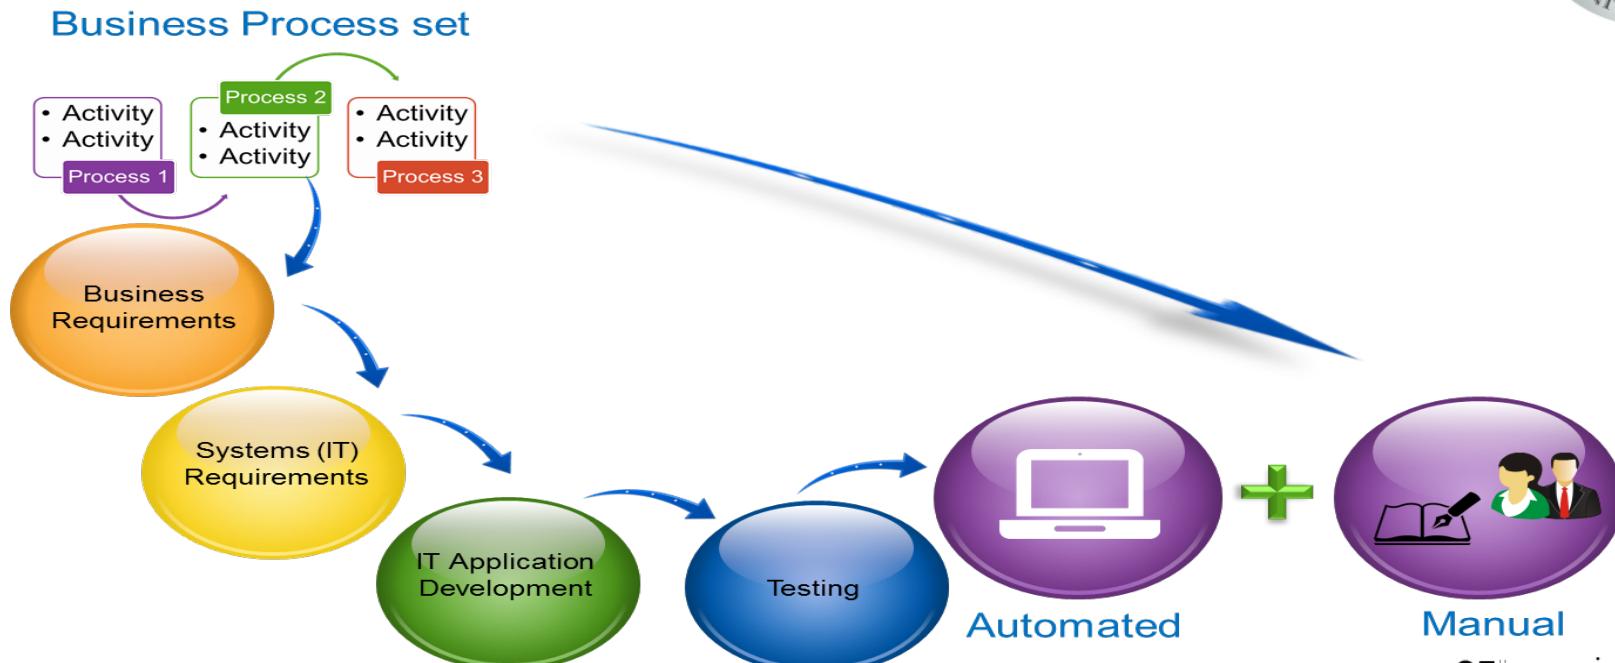

**Operations Procedure set**

**Operations staff & Training**

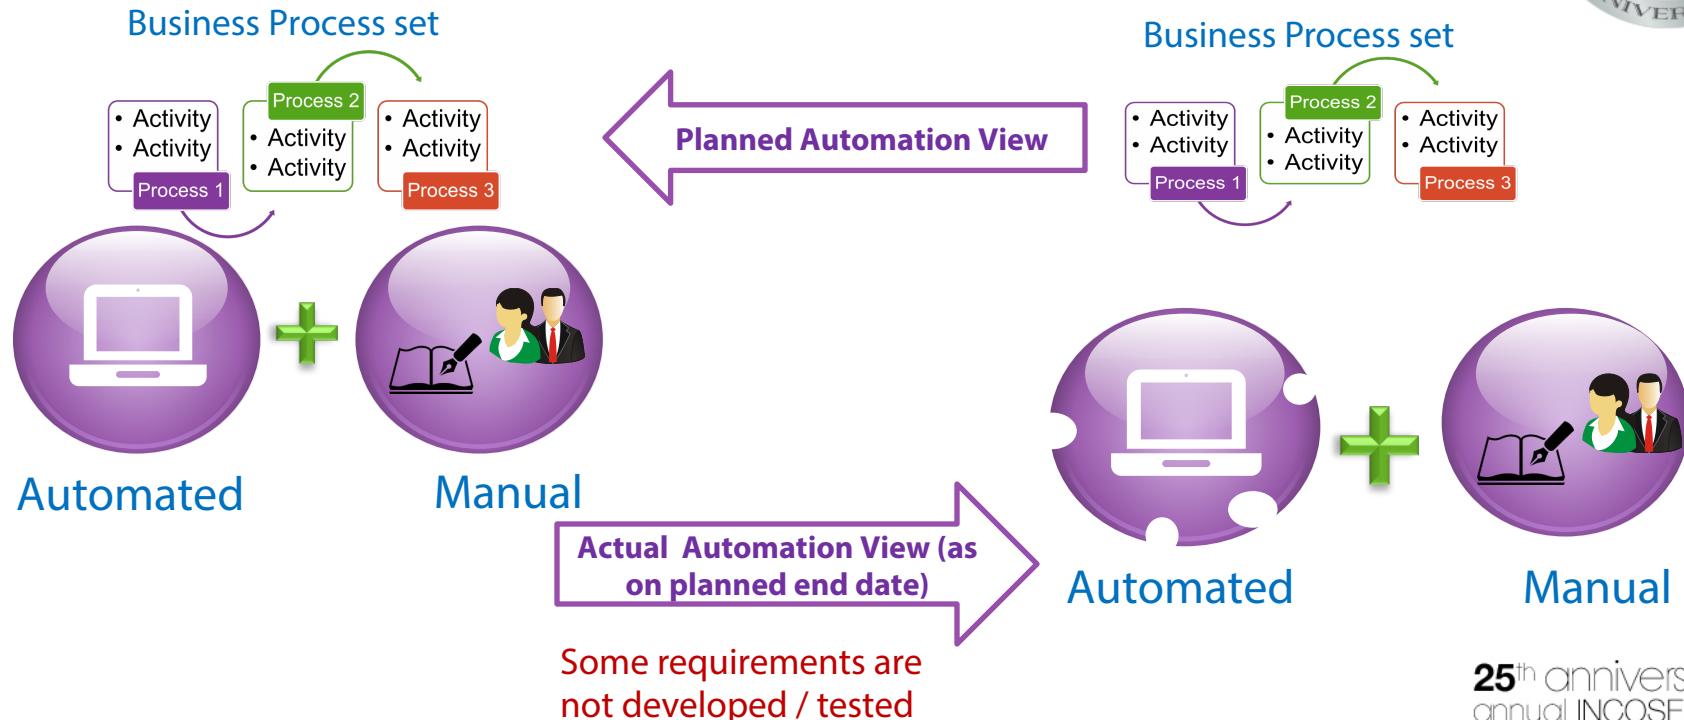

# Challenge....contd;

*IT application delivers the automated part of Business Process*

# Challenge....contd;

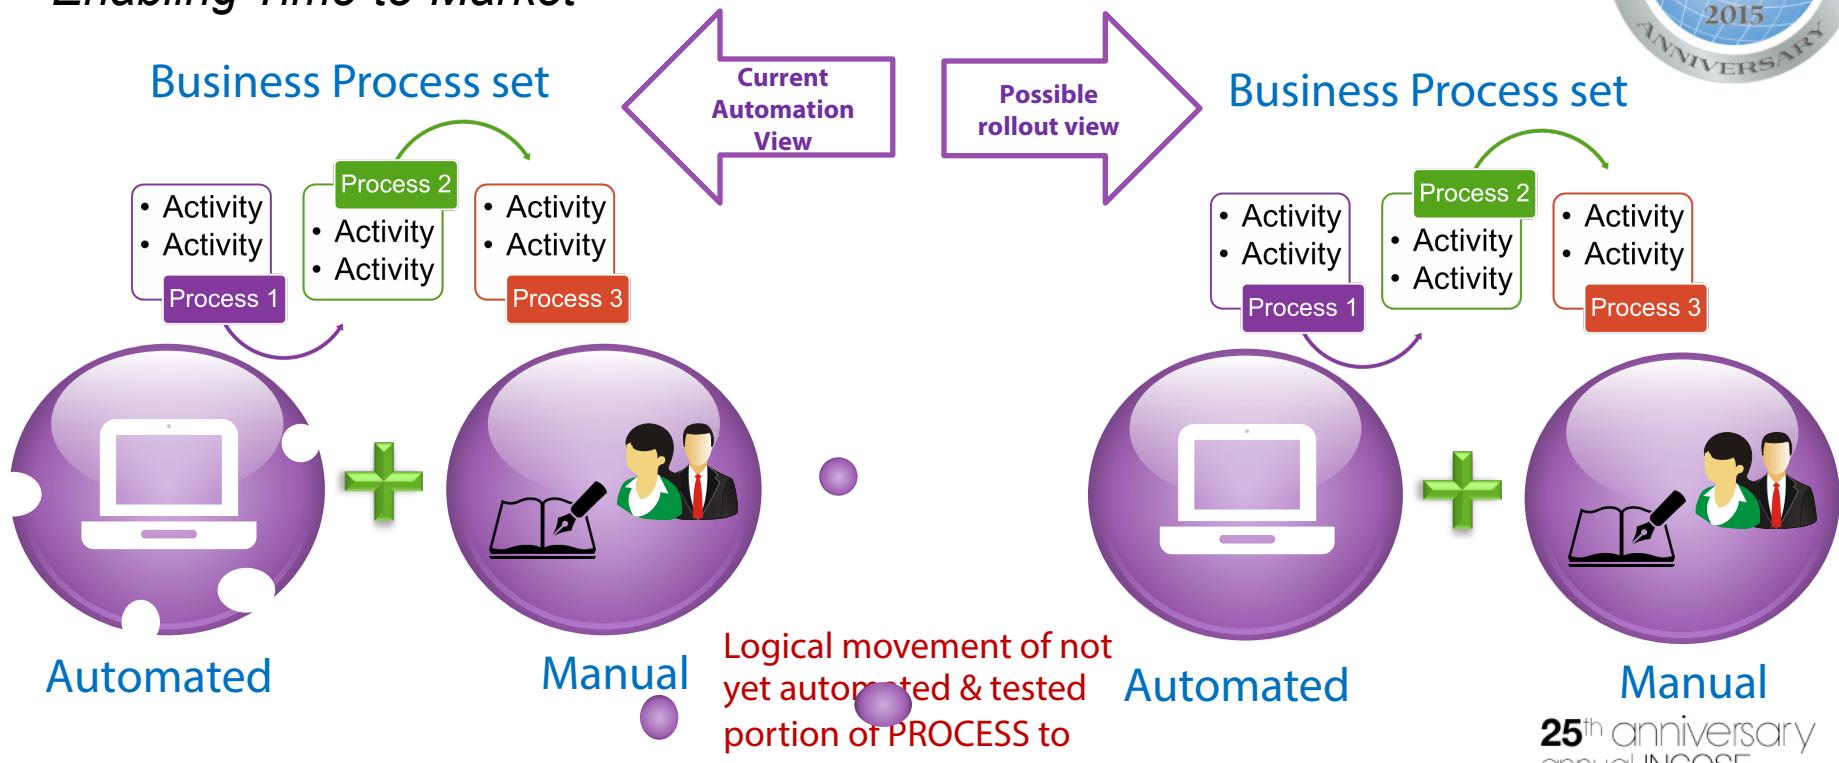

*Delivery challenges : Planned vs Actual*

# Solution

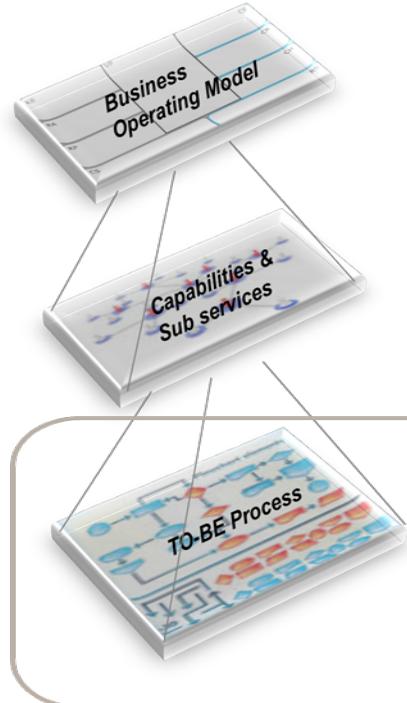

## Enabling Time-to-Market

# Solution ....contd;

## *Creating the Business Process view*

Level 1

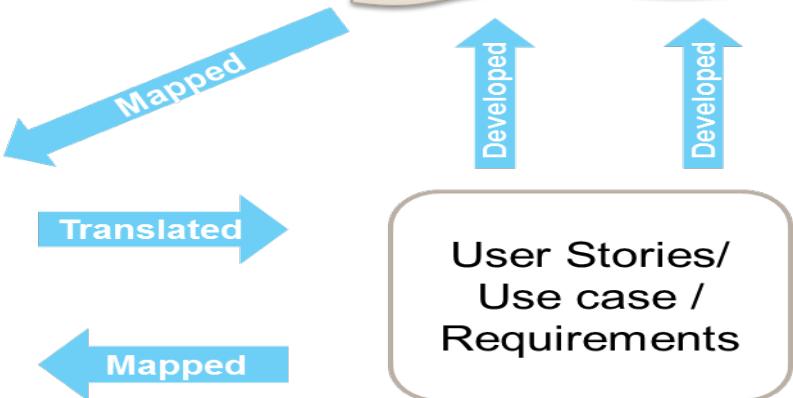

Level 2

Level 3, 4, 5

- Illustrates the interface between the components

- Describes high level life cycle and main activities of each of the components
- Links Component level services to process maps

- Process flow-charts
- RACI
- Risk & Controls
- Business rules
- Interfaces
- Tasks

# Solution ....contd;

## Business Process view example

<b>Total</b>	<b>30</b>		<b>56.60%</b>	<b>111</b>	<b>60</b>	<b>64.91%</b>	<b>980</b>		<b>91.16%</b>

Holistic Perspective

Operations Readiness

Standard Perspective

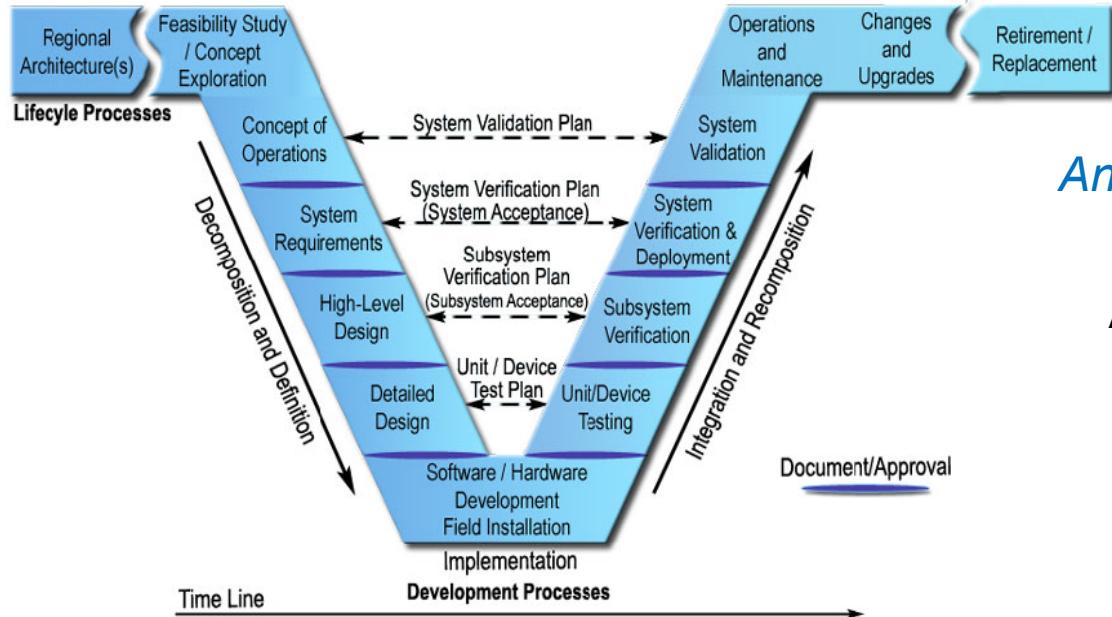

Requirements View

6% improvement in system will increase operations readiness from 20% to 100%

Whole of FM function can be managed outside the application

# Alignment with Vee-Model

*System validation against the Concept of operations*

*Answering the questions :*

*Are we building it right ?*

*How much have we built right ?*

Reference : "Systems Engineering for ITS", Dept. of Transportation, USA

# Comparison with “Use case”

*A use case typically describes how an actor uses the software to materialize a goal(s), which captures the requirements as part of the template.*

- Use cases are based on business scenarios & in reality, would result in execution of multiple business processes in sequence or sometimes a portion of the business process depending on the granularity. i.e; **a combination of Business Process**
- Is considered a SDLC artifact by the business teams, but knowledge rests with business operations
- Considered as an overhead over requirements specifications and hence usually done by IT teams
- To create an operations concept view using use cases, they will have to be mapped to business process

# Thank You
