# Proposed framework and research questions

## Research questions:

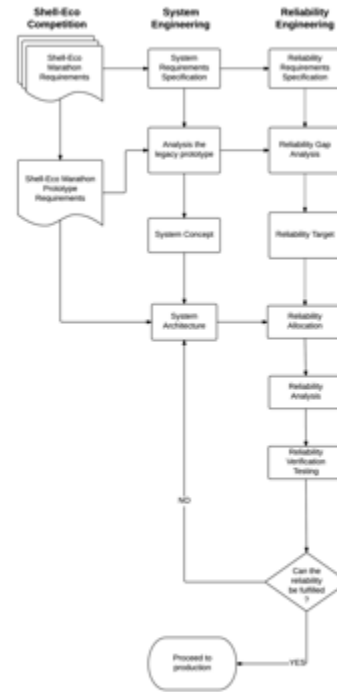

1. *How can an integrated reliability and systems engineering framework bring value to the development of systems?*
2. *How can the proposed framework be used to assess the reliability of the system in the early design phases where there is high uncertainty due to lack of information?*

# Discussion and future work

## 1. *How can an integrated reliability and systems engineering framework bring value to the development of systems?*

- Two main characteristics of the proposed framework: 1) SE and RE must be conducted concurrently. 2) The framework must be applied at early stages of development.
- Using the framework, the consequences of poor reliability requirements can be reduced by considering reliability requirements into the system specification as early as possible.
- Knowing beforehand the impact of potential failure(s) in system's design, reduces or eliminates the need for late changes in systems life cycle.

# Discussion and future work

## 2. *How can the proposed framework evaluate the reliability of the system in the early phases where there is lack of information?*

- using RBD enabled us to see how the components of the systems are structured. Also, it indicated that how the components are functioning dependently or independently.
- FMECA, on the other hand, was useful to find potential failures at early stage of the lifecycle, and showed us how to mitigate their risks.
- FTA, also indicated that what are the critical events that must be avoided.
- A reliability checklist has been developed.

System _____ Assembly _____		Ref.No. _____ Date _____		
NO.	M* or A*	Checklist question	Yes	No
1	M	Have the hoses been connected to the connectors?	<input type="checkbox"/>	<input type="checkbox"/>
2	M	Have the calipers been properly adjusted with suspensions?	<input type="checkbox"/>	<input type="checkbox"/>
3	M	Have the hydraulic systems been bled to remove the air?	<input type="checkbox"/>	<input type="checkbox"/>
4	M	Have the caliper pads been properly adjusted with disks?	<input type="checkbox"/>	<input type="checkbox"/>
5	M	Have the levers been properly mounted on steering wheel?	<input type="checkbox"/>	<input type="checkbox"/>
6	M	Have the bolts been checked to avoid leakage?	<input type="checkbox"/>	<input type="checkbox"/>
M* = Mandatory      A* = Advisory				

## Discussion and future work

1. The SE part of this framework has applied for the whole system, and the reliability of that applied on braking system. The author believes both SE and RE part this framework could be applied on entire system lifecycle.
2. Also, the reliability assessment of the braking system was qualitative. The author suggests to conduct quantitate assessment as well.
