Challenges for SI**

Complex System Governance

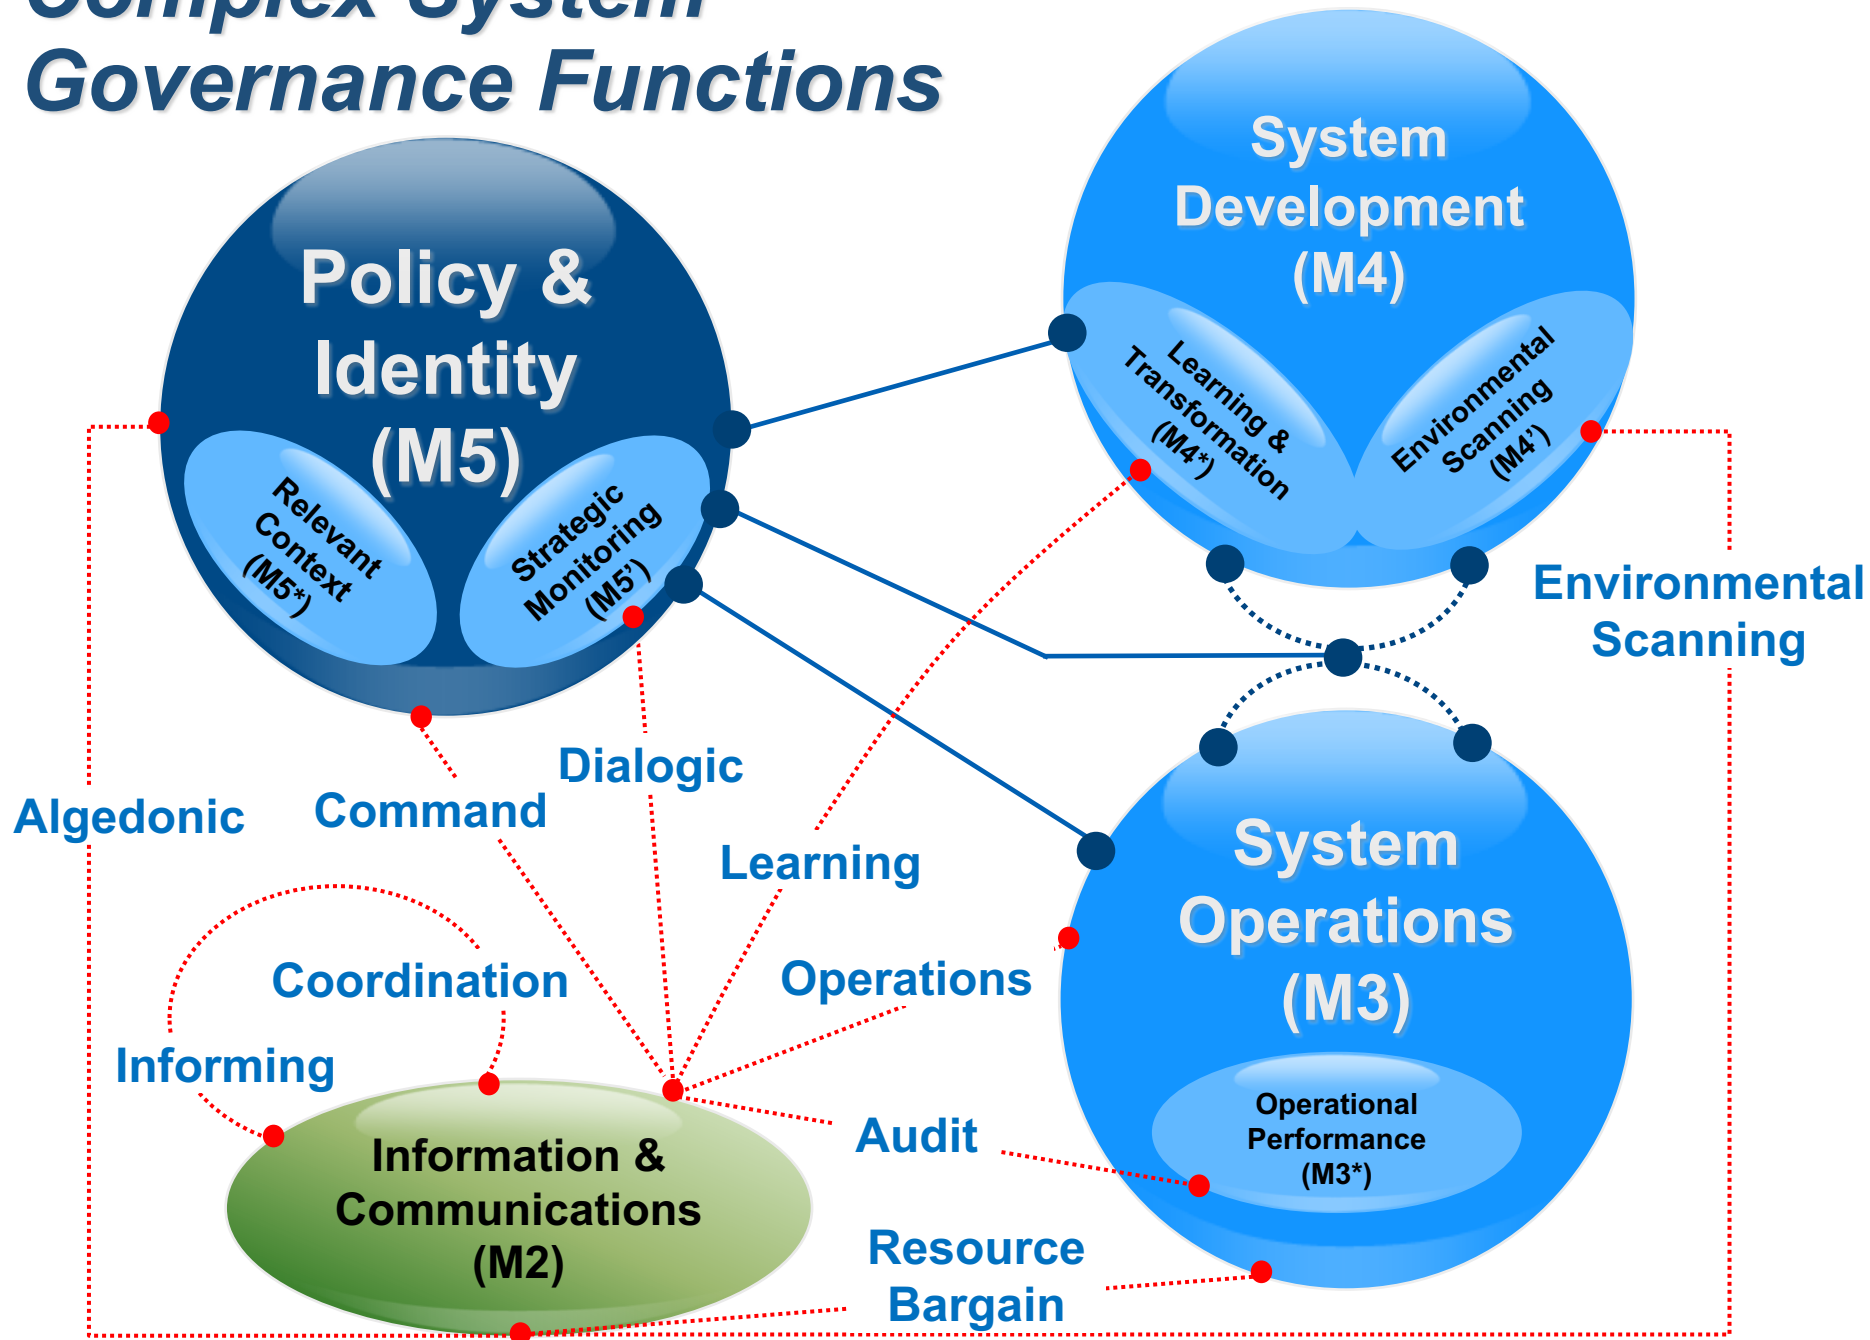

Complex System Governance

CSG is the design, execution, and evolution of the [nine] metasystem functions necessary to provide control, communication, coordination, and integration of a complex system
(Keating, et al. 2014)

Keating, C.B., Katina, P.F., & Bradley, J. M. (2014). Complex system governance: concept, challenges, and emerging research. *International Journal of System of Systems Engineering*, 5(3), 263-288.

Complex System Governance Functions

Complex System Governance – in a nutshell of 5 fundamentals points

All systems are subject to the laws of systems

All systems perform essential governance functions that determine system performance.

Governance functions can experience pathologies in their performance.

Pathologies linked to ‘violation’ of one or more system principles

System performance can be enhanced through purposeful development of governance functions & addressing pathologies

PATHOLOGY

“circumstance, condition, factor, or pattern that acts to limit system performance, or lessen system viability, such that the likelihood of a system achieving performance expectation is reduced” (Keating and Katina, 2012, p. 253)

EXAMPLE

M2.11. Introduction of uncoordinated system changes resulting in excessive oscillation.

Cost Overrun

Schedule Overrun

OBSERVED FAILURE(s)

Missed Performance Target

High Employee Turnover

UNOBSERVED FAILURE SOURCES

Same underlying system pathology appears as 'different' surface issues

36	M3*1. Limited accessibility to data necessary to monitor performance.	3*1 We have access to sufficient information to monitor system performance.
37	M3*2. [SYSTEM OF INTEREST]-level operational performance indicators are shared.	3*2 We have an effective set of operational performance indicators.
38	M3*3. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	4.6.2. The crises we encounter are for the most part manageable.
39	M3*4. Strategic planning thinking focuses on operational level planning and improvement.	4.5 This is taken care of by 4.4.1 and 5.3
40	M3*5. Limited learning achieved related to operations.	4*1 We effectively respond to shifts in the environment.
41	M3*6. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	
42	M3*7. Strategic planning thinking focuses on operational level planning and improvement.	
43	M3*8. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	
44	M3*9. Strategic planning thinking focuses on operational level planning and improvement.	
45	M3*10. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	
46	M3*11. Strategic planning thinking focuses on operational level planning and improvement.	
47	M3*12. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	
48	M3*13. Strategic planning thinking focuses on operational level planning and improvement.	
49	M3*14. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	
50	M3*15. Strategic planning thinking focuses on operational level planning and improvement.	
51	M3*16. Strategic planning thinking focuses on operations - limited time devoted to strategic planning.	

Systemic Intervention

Four Types of Intervention

	FORM	APPROACH	ACCOUNTABILITY	RISK
1	<i>Additive Resources</i>	Add resources	Agent for resource adequacy	Agent
2	<i>Problem Resolution</i>	Resolve problem	Agent for solution	Agent
3	<i>Expert Advice</i>	Expert advice	Target for advice implementation	Target
4	<i>Participatory</i>	Collaborative improvement	Shared between agent and target	Agent & Target

Systemic Intervention

The purposeful action by an agent, generally human for complex systems, to produce change in a system or situation

"It's some new thing called ~~an~~ intervention."

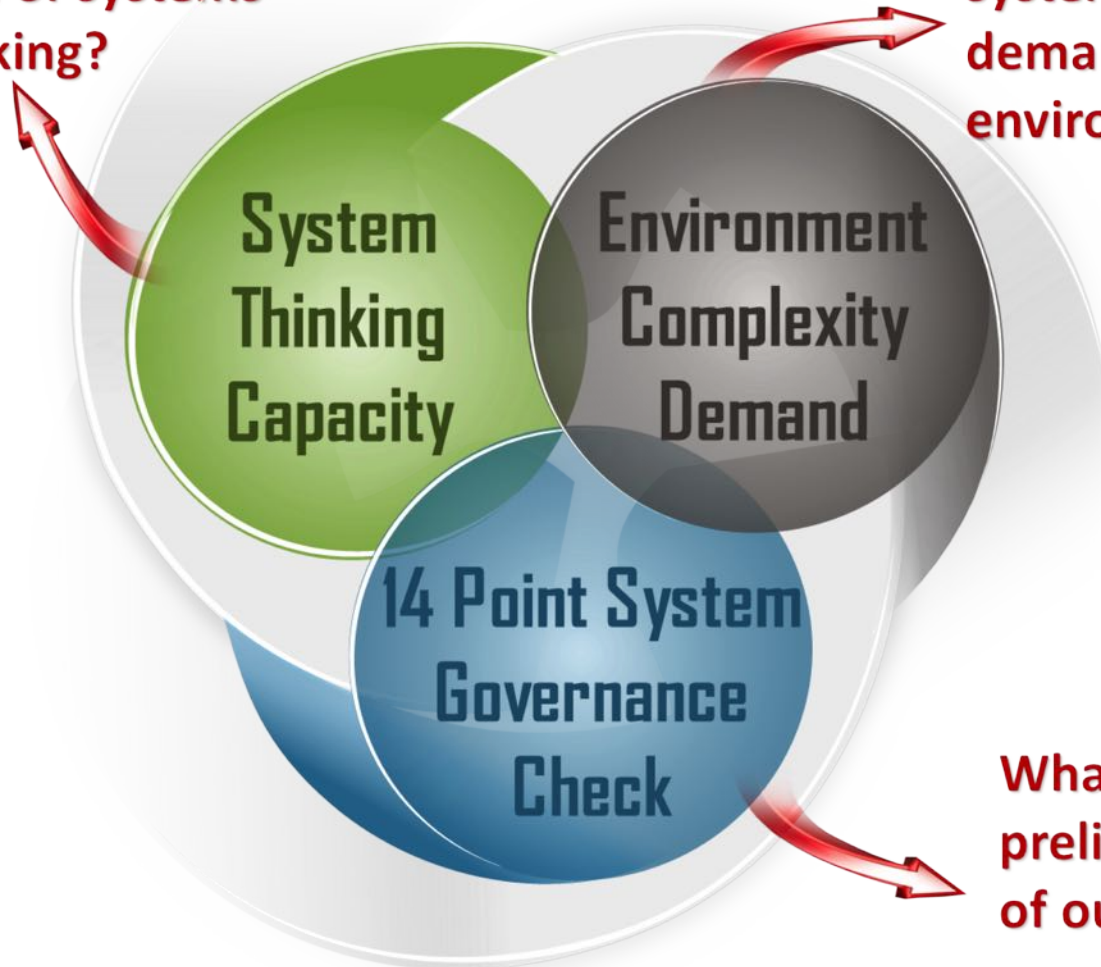

CSG Intervention

– Approach and Some Results

Complex System Governance Entry

What is our current
level of systems
thinking?

What level of
systems thinking is
demanded by our
environment?

What is the
preliminary state
of our system
governance?

Composite Systems Thinking Capacity and Environment Complexity Demand

14 Point Governance Check

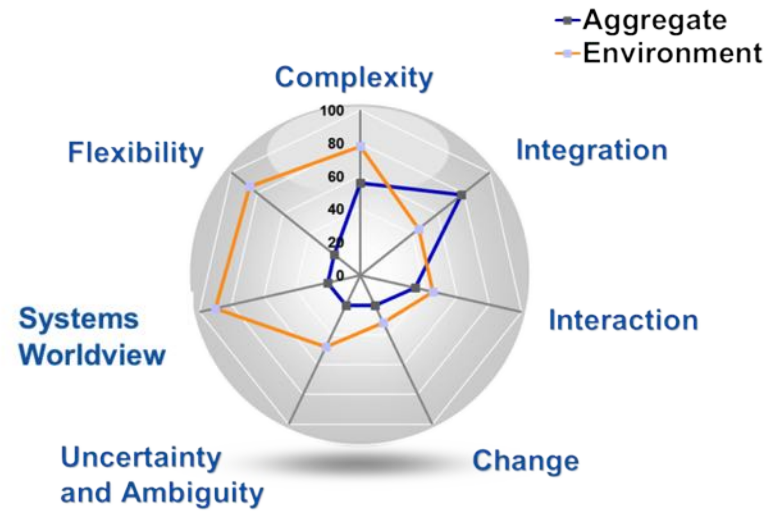

(1 less effective, 5 more effective)

Results: What we have been able to do

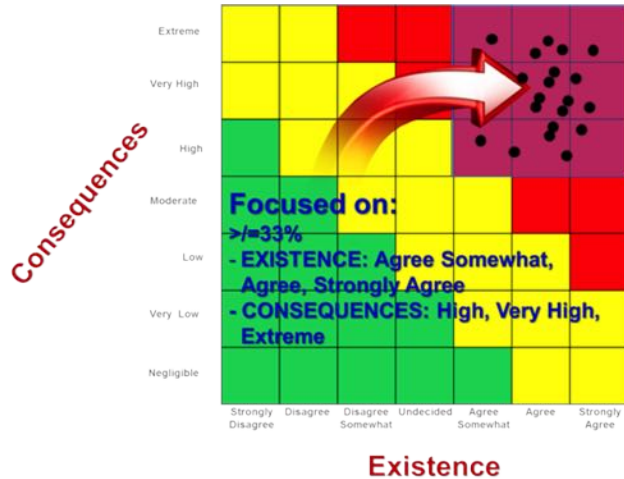

1

Identification of gaps between workforce systems thinking capacity and complexity demanded by the environment

2

Identification, mapping, and prioritization of pathologies for CSG landscape

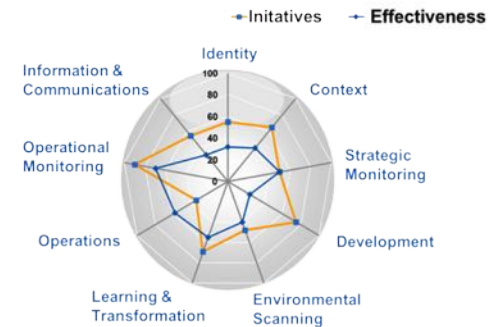

Pathologies Mapped

Pathologies Ranked

Governance Check Aggregate Profile

Lessons Learned and Challenges

Lessons Learned: 5 Take Aways

- 1 CSG is not the entry point; system concerns are the entry point
- 2 CSG value potential is shown by translation into operational and strategic concerns
- 3 CSG engagement is not a binary proposition – but a spectrum of focus, activity, and value
- 4 CSG cannot be cast as “in addition to” (IAT), but amplifying effectiveness of what is already being done
- 5 CSG Engagement time & risk must initially fall on CSG Facilitator(s)

8R Framework for Systemic Intervention

Rigidity

Flexibility in design and execution of system development effort

Relevance

Recognition of need, measurable value, comprehensive nature, and relationship to other development efforts

Responsibilities

Clarity in definition of roles and obligations with respect to the system and effort

Realism

Consistency between expectations and feasible system development activities

Rigor in Execution

Adherence to the design to create feasible alternatives for development

Resolve

Institutional will and commitment to the effort and system development sustainment

Resources

Provision for sufficient resources and access necessary to engage in the effort

Requisite Compatibility

Congruence in worldview, support infrastructure, approach, context, and risk-threat-reward balance
