# Introduction

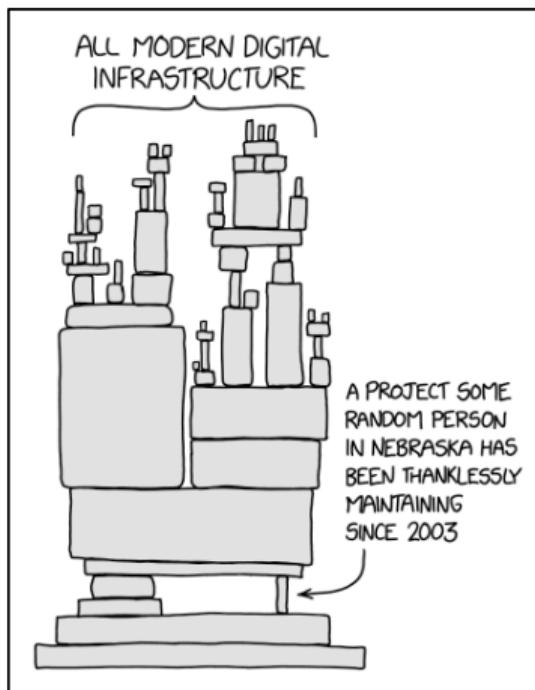

## → Digital Engineering Goals: Analyzed and Decomposed

## → Digital Engineering Goals: Establish Infrastructure & Environment

## → Challenge: The Normalization of Deviance in Modern Computing

We build our computer systems the way we build our cities: over time, without a plan, on top of ruins.

## → Defining Seamless Digital Engineering

Following prior work in ‘seamless model-driven systems engineering’<sup>1</sup>, and inspired by DARPA CRASH<sup>2</sup>, CRAFT<sup>3</sup>, and META-II<sup>4</sup>, we identified and defined a grand challenge<sup>5</sup> in digital engineering research<sup>6</sup>:

### Definition (Seamless Digital Engineering)

*A digital engineering tooling paradigm that guarantees model coherence and integrity by affording an elegant human-computer interface for systems modeling that is end-to-end formally verified down through the computer hardware.*

## Background

## → Ontology Development using Protégé and OWL 2

**Protégé** is a free, open-source software that allows you to create and manage ontologies for various domains and applications. It supports Semantic Web standards, plug-ins, and web-based access to your knowledge.

<https://protege.stanford.edu/>

The **OWL 2 Web Ontology Language**, informally OWL 2, is an ontology language for the Semantic Web with formally defined meaning. OWL 2 ontologies provide classes, properties, individuals, and data values and are stored as Semantic Web documents.

## → Logic in Formal Ontology Modeling

OWL Description Logic (DL)<sup>1</sup> is a subset of First-Order Logic (FOL) with extensions:

Symbol	Description
$\mathcal{AL}$	(Attributive Language) Inclusion, equivalence, intersection, and complex definition of classes
$\mathcal{ALC}$	(with Complement) Adds to $\mathcal{AL}$ the empty, complement, union classes <sup>2</sup>
$\mathcal{S}$	Adds the transitivity of relations to $\mathcal{ALC}$
$\mathcal{H}$	Inclusion and equivalence between relations
$\mathcal{O}$	(One of) Classes created with list of all and only the individuals contained
$\mathcal{I}$	(Reverse) Inverse property
$\mathcal{N}$	(Number) Cardinality restriction
$\mathcal{D}_n$	(Countable domain) Definition of domains (data types)

<sup>1</sup> World Wide Web Consortium 2012; ISO 2021a    <sup>2</sup> Baader, Horrocks, and Sattler 2008

## → Basic Formal Ontology (BFO)

**Basic Formal Ontology**<sup>1,2</sup> (BFO-2020 – ISO/IEC 21838-2) contains classes and relations representing content common to all areas of scientific investigation, e.g. object, process, etc. and is used as a top-level architecture by numerous ontologies in the Industrial Ontologies Foundry (IOF), and the **Common Core Ontologies** suite.

Ontologies conformant to BFO promote *interoperability, standardization, and reuse* among domain-level ontologies.

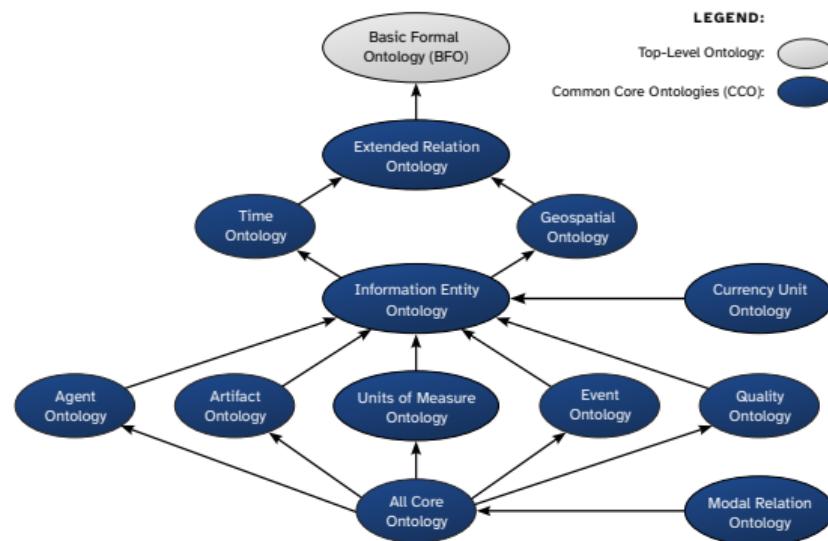

<sup>1</sup> Otte, Beverley, and Ruttenberg 2022 <sup>2</sup> <https://github.com/BFO-ontology/BFO-2020>

## → Common Core Ontologies (CCO)

### The **Common Core Ontologies**<sup>1,2</sup>

comprise twelve (12) ontologies that are designed to represent and integrate taxonomies of generic classes and relations across all domains of interest.

CCO is a mid-level extension of Basic Formal Ontology (BFO), an upper-level ontology framework widely used to structure and integrate ontologies.

<sup>1</sup> Jensen et al. 2024 <sup>2</sup> <https://github.com/CommonCoreOntology/CommonCoreOntologies>

3

## Methodology

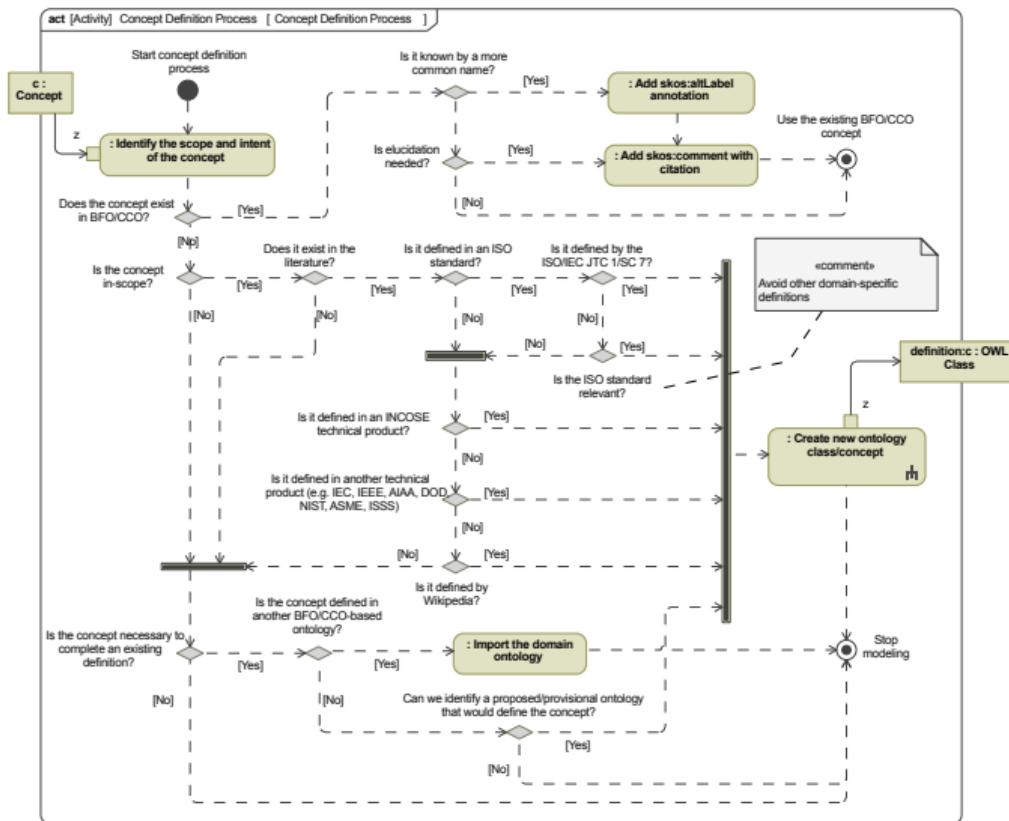

## → Basic Methodology for Ontology Development

Following Noy and McGuinness<sup>1</sup>, we adapted their methodology for OWL 2:

1. Determine the domain and scope of the ontology
2. Consider reusing existing ontologies
3. Enumerate important terms in the ontology
4. Define the classes and the class hierarchy
5. Define the object properties
6. Define the domains/ranges of object properties
7. Create instances (individuals) of classes

## Ontological Definition of Seamless Digital Engineering

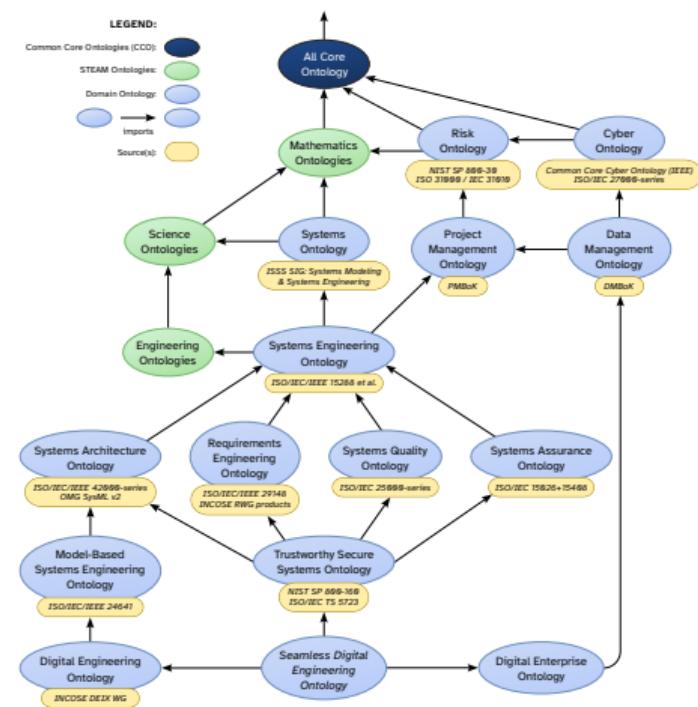

→ ISO/IEC 25000-series SQuaRE Product Quality Model

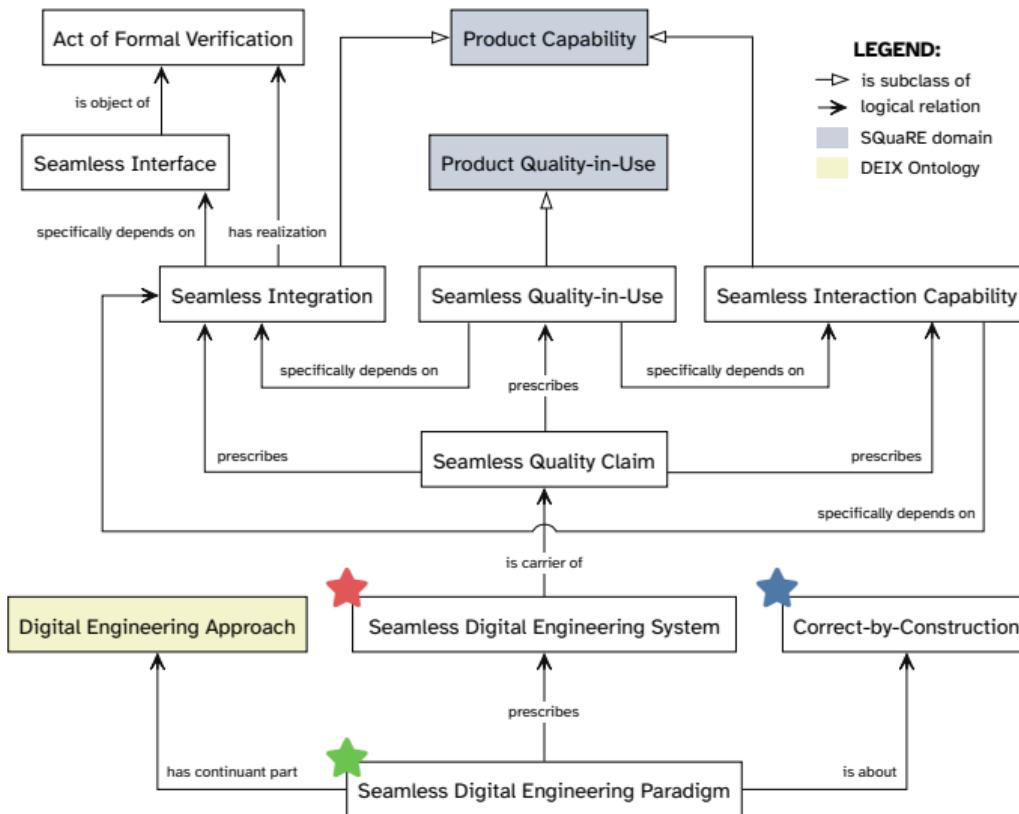

## → The Seamless Digital Engineering Ontology Is Standards-Based

Standard top-level (BFO) and mid-level (CCO) ontologies are the foundation of coherent ontological modeling in the DE domains of knowledge. Relevant international standards include (Table 2):

- **ISO/IEC/IEEE 15288** – System life cycle processes
- **ISO/IEC 25000-series** – Systems and software Quality Requirements and Evaluation (SQuaRE)
- **ISO/IEC/IEEE 15026** – Systems and software assurance
- **ISO/IEC/IEEE 42000-series** – Architecture description and processes
- **ISO/IEC 15408** – (“Common Criteria”) Evaluation criteria for IT security
- **ISO/IEC/IEEE 24641** – Methods and tools for MBSSE
