# Agenda

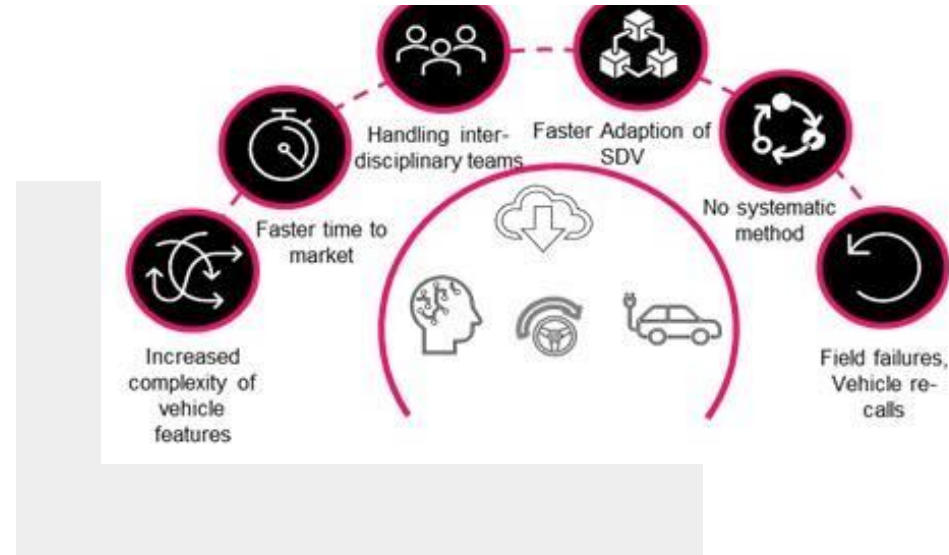

Accelerating MBSE Agile deployment for Next gen  
Automotive Architecture with gen AI based SysML v2

- Problem Description
  - Current Technology Scenario
  - System Engineering smoothens transformations!
- Solution inspiration
- Possible Solution
- Solution Benefits
- Comparative Analysis
- QnA

# Current Technology Scenario

Technological Transformations are predominant in every walk of life!!  
Automotive domain is no exception!

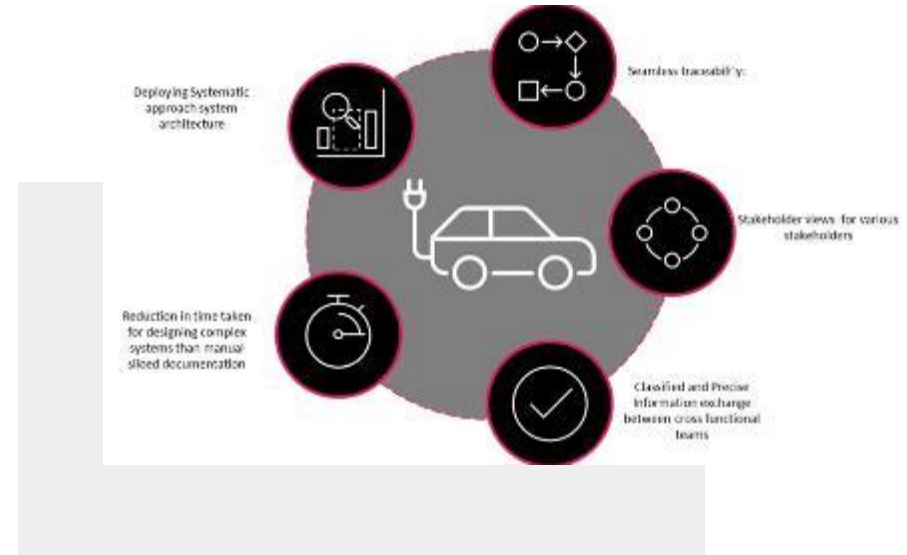

- Sustainability, Autonomous
- Best of customer experience
- Artificial Intelligence
- Connected & Data driven

# Systems Engineering smoothens transformations!

Emerging complexity can be well-managed by adopting systems engineering best practices..

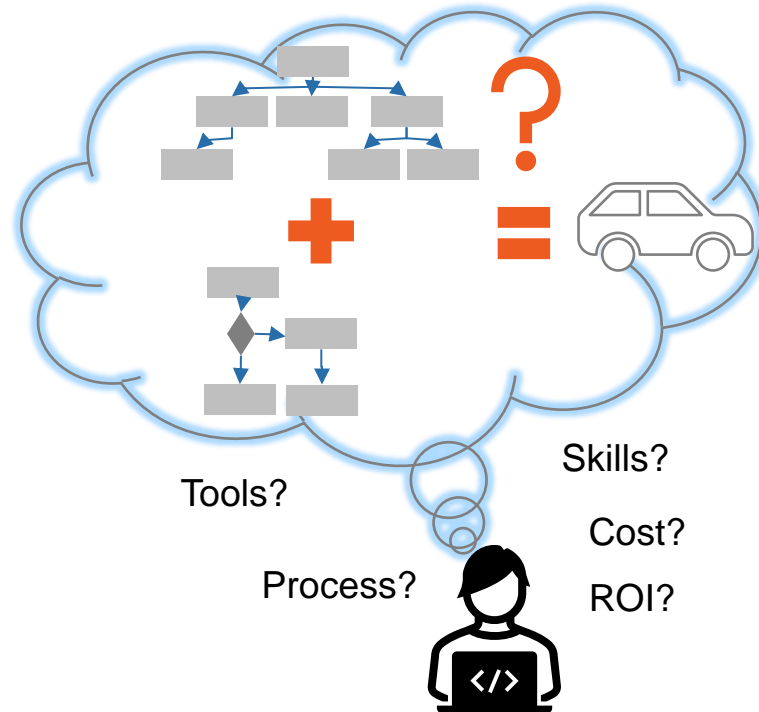

- Model Based Systems Engineering
- Enabling Cross functional Interactions
- Shift Left in lifecycle
- Optimizing development time
- Improving KPIs - quality and time to market

# Solution inspiration

While Auto industry is convinced about benefits of MBSE however MBSE deployment still faces many challenges!

- Lack of skills
- Lengthy, inefficient process
- Tool dependency
- No seamless Tool integrations
- Question on ROI!

# Solution

The proposed solution has following pillars

## Gen AI

- With the advent of GenAI, the Gen AI model can be trained to analyze given inputs and come up with the required notation. (SysML V2 in this case)
- This saves time and effort in coming up with the SYsML diagrams from scratch

## SysML V2

- Text based notation
- Equivalent to graphical notation
- Text nature is advantageous to generate automatically as well as to maintain pipeline in a work flow for system engineering activities

## Agile practice through CI/CD

- SysML V2 model artifacts can be integrated in pipeline
- Accelerates the integration of systems engineering artifacts as input to software development lifecycle (SDLC)
- Enables collaborative, agile working environment

The proposed solution has following high level flow

*Feature: The system shall apply gentle steering inputs to keep the vehicle within its lane if it detects an unintended lane departure.*

Generate a Stakeholder Requirement Table and Requirement diagram in SysML v2 textual notation for the Lane Keeping Assistance (LKA) feature.

SR_ID	SR_Name	SR_Description	Derived From
SR_LKP_01	Lane Keeping Assistance	The system shall apply gentle steering inputs to keep the vehicle within its lane if it detects an unintended lane departure.	*Root*
SR_LKP_02	Lane Departure Detection	The system shall detect unintended lane departures using sensors and cameras.	SR_LKP_01

```
package LaneAssistanceRequirements {
  private import RequirementDerivation1::*;
  // Stakeholder Requirements
  requirement <SR_LKP_01> 'Lane Keeping Assistance' {
    doc/* The system shall apply gentle steering inputs to keep the
    vehicle within its lane if it detects an unintended lane departure. */
    requirement <SR_LKP_02> 'Lane Departure Detection' {
      doc/* The system shall detect unintended lane departures using
      sensors and cameras. */
    }
  }
  // Derivation Connections
  derivationConnection {
    end #original :> 'Lane Keeping Assistance';
    end #derive :> 'Lane Departure Detection';
  }
}
```

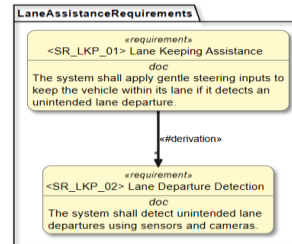

jupyter act\_main Last Checkpoint: 22 hours ago

```

1 package LaneAssistanceRequirements
2 private import RequirementDerivation::;
3 // Stochastic Requirements
4 requirement <"Stochastic" > "Lane Keeping Assistance"
5 doc<"The system shall apply gentle steering
6 inputs to keep the vehicle
7 within its lane if it detects an
8 unintended lane departure." />
9 requirement <"SVC_KP_02" > "Lane Departure Detection"
10 doc<"The system shall detect unintended
11 lane departures using sensors
12 and cameras." />
13 // Derivation Connections
14 derivation connection <
15     and #original >> "Lane Keeping Assistance"
16     and #derive >> "Lane Departure Detection";>

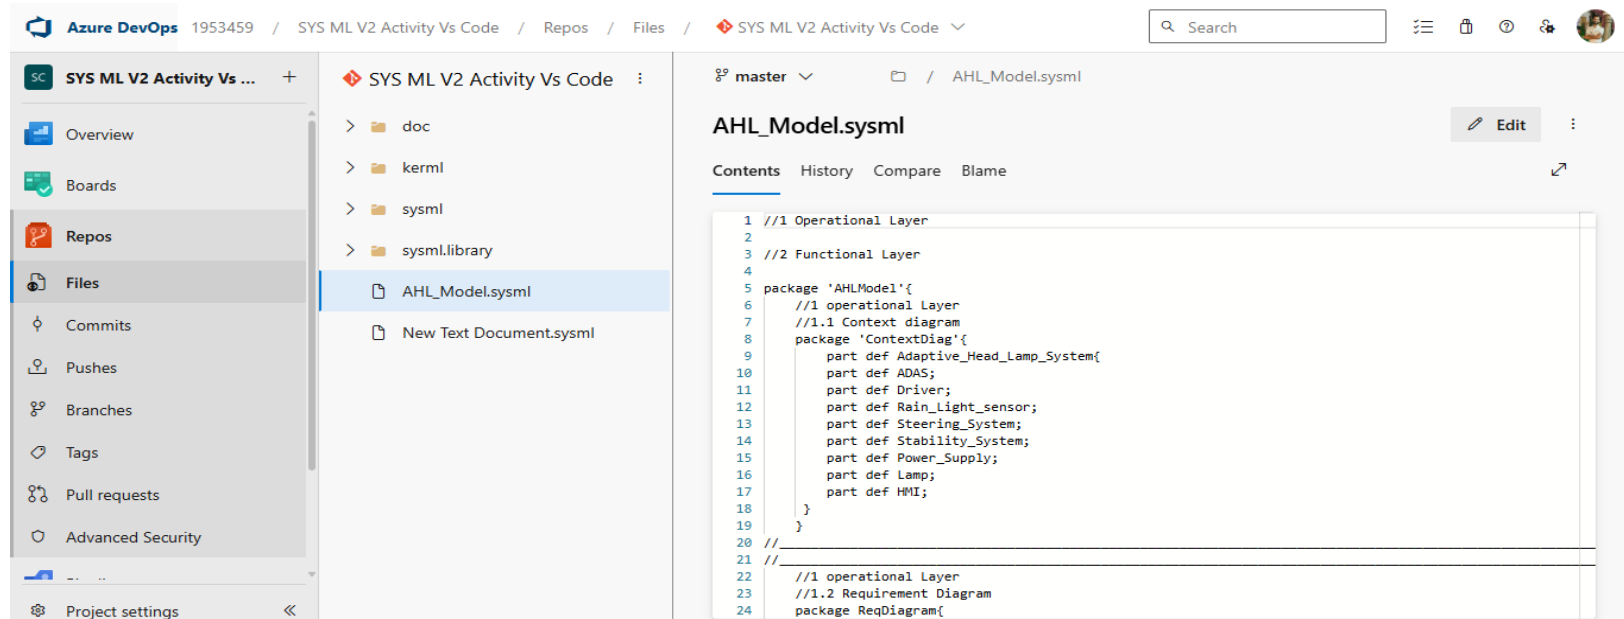

```

```
%viz --view tree --style stdcolor LaneAssistanceRequirements
```

# Agile practice through CI/CD

The SysML V2 notation can be maintained and the complete model can be worked upon collaboratively

The screenshot displays the Azure DevOps web interface for a repository named 'SYS ML V2 Activity Vs Code'. The left sidebar shows the 'Files' view, with the file 'AHL\_Model.sysml' selected. The main editor area shows the SysML V2 notation for 'AHL\_Model.sysml'.

24 package ReqDiagram{
  
```

# Solution Benefits

Below are direct benefits one will get with the solution that we have mentioned.

## Improved quality and lesser rework

- Auto generation of SysML V2 notation can result in outputs which are compliant to rules
- Reduction in manual errors
- Review efforts lesser

## No binding with costly tools

- SysML V2 being standardized interface, supported by multiple tools, no dependency on single tool
- Increased Flexibility on tool usage, bottleneck due to a particular tool eased out with alternate tools, for time and cost optimization

## Time and Effort reduction

- Design time reduction due to shift left approach
- Reduction in manual efforts of drawing SysML diagrams
- Upskilling time for learning SysML V2 is lesser than a tool specific SysML graphical notation
- Faster delivery

## Agile way of MBSE

- SysML V2 notations can be maintained in cloud based collaborative working platforms
- CI/CD platform helps in task planning, e.g. kanban board and to track the task and reviews

## Effective return on investment

- Optimization of infrastructure cost is possible
- Improved quality and reduced rework
- Lesser upskilling efforts

# Comparative Analysis

Deploying newer practices may have benefits over conventional way, based on some of the in progress POCs we initiated-

	Conventional way	Our solution
<b>Time Required</b>	At least 3 day a diagram, it increases based on increased complexity	1 day a diagram and as newer technique handles the complexity better, so no further increase in time if complexity increases
<b>Tools Costings</b>	SysML tool costs around 10-12K USD	GPU+LLM+Data+ PC cost ~ 5-6 K USD
<b>Skills required</b>	Continuous learning and tool experience required	Training time relatively lesser for text notation
<b>Review time required</b>	Manual review requires 1 day per diagram, for complex design, review time will increase	Manual review requires 1 day per diagram, review comments may be lesser
<b>Quality of output</b>	Human errors possible- grammatical , spelling , some time relation direction errors	Much less human error and errors can be detected easily with Gen Ai
